Periodic Monitoring Report for Pajarito Watershed, December 4–December 20, 2006; March 19–April 8, 2007; and June 25–July 15, 2007

Los Alamos
NATIONAL LABORATORY
EST. 1943

Prepared by Environmental Programs Directorate

Los Alamos National Laboratory, operated by Los Alamos National Security, LLC, for the U.S. Department of Energy under Contract No. DE-AC52-06NA25396, has prepared this document pursuant to the Compliance Order on Consent, signed March 1, 2005. The Compliance Order on Consent contains requirements for the investigation and cleanup, including corrective action, of contamination at Los Alamos National Laboratory. The U.S. government has rights to use, reproduce, and distribute this document. The public may copy and use this document without charge, provided that this notice and any statement of authorship are reproduced on all copies.

EXECUTIVE SUMMARY

The purpose of this report is to provide the results of three periodic monitoring events (PMEs) conducted by Los Alamos National Laboratory in the Pajarito Watershed. These PMEs for Pajarito Watershed were conducted pursuant to the "Interim Facility-Wide Groundwater Monitoring Plan," prepared under the Compliance Order on Consent.

The three PMEs documented in this report occurred from December 4 to December 20, 2006; March 19 to April 8, 2007; and June 25 to July 15, 2007. These events included sampling of groundwater wells or well ports, springs, and base flow stations.

Water samples obtained from various locations during this PME were analyzed for target analyte list metals, volatile organic compounds, cyanide, semivolatile organic compounds, pesticides, polychlorinated biphenyls, high explosives, radionuclides, low-level tritium, general inorganic chemicals, perchlorate, stable isotopes, and field parameters (alkalinity, dissolved oxygen, iron, pH, specific conductance, temperature, and turbidity).

The results from the three PMEs included in this report are summarized for each sampling event as follows:

December 4–December 20, 2006, PME
One surface-water sample, which was collected during this PME from Pajarito Canyon, exceeded regulatory standards or screening levels.

Twelve groundwater samples, which were collected during this PME from Pajarito Canyon, exceeded regulatory standards or screening levels.

March 19–April 8, 2007, PME
Three surface-water samples, which were collected during this PME from Pajarito Canyon, exceeded regulatory standards or screening levels.

Twenty-one groundwater samples, which were collected during this PME from Pajarito Canyon, exceeded regulatory standards or screening levels.

June 25–July 15, 2007, PME

Three constituents in surface-water samples, which were collected during this PME from Pajarito Canyon, exceeded regulatory standards or screening levels.

Eleven constituents in groundwater samples, which were collected during this PME from Pajarito Canyon, exceeded regulatory standards or screening levels.

1.0 INTRODUCTION

This report provides documentation of quarterly groundwater and surface-water monitoring conducted by Los Alamos National Laboratory (LANL or the Laboratory) in the Pajarito Watershed pursuant to the "Interim Facility-Wide Groundwater Monitoring Plan" (IFGMP) (LANL 2006, 094043) prepared under the Compliance Order on Consent (Consent Order). This report combines three periodic monitoring events (PMEs) that occurred from December 4 to December 20, 2006; March 19 to April 8, 2007; and June 25 to July 15, 2007. These sample events included sampling at groundwater wells or screens, springs, and base flow stations.

This report presents the following information:

- General background information on the watershed
- The watershed conceptual model
- Field-measurement monitoring results
- Water-quality monitoring results
- Results of the screening analysis (comparing these PME results with regulatory standards and results from previous reports)
- Conclusions drawn based on the data and the screening analysis
- Information on radioactive materials and radionuclides, including the results of sampling and analysis of radioactive constituents, is voluntarily provided to the New Mexico Environment Department (NMED) in accordance with U.S. Department of Energy (DOE) policy.

1.1 Background

This section describes the physical characteristics of the Pajarito Watershed, some of the investigatory activities conducted, and the Laboratory activities that have potentially impacted groundwater and surface water.

Pajarito Canyon is located on the Pajarito Plateau in the central part of the Laboratory. The Pajarito Canyon watershed is approximately 13 mi^2 in area and heads in the Santa Fe National Forest, approximately 2.9 mi (4.6 km) west of the Laboratory boundary at an elevation of approximately 10,434 ft (3180 m). Pajarito Canyon trends east-southeast across the Laboratory and Los Alamos County. It discharges into the Rio Grande in White Rock Canyon at an elevation of 5422 ft (1653 m). Twomile Canyon and Threemile Canyon are major tributaries that join Pajarito Canyon, approximately 7.3 mi (11.7 km) and 4.9 mi (9.3 km), respectively, upstream of the Rio Grande.

The primary Laboratory use of the Pajarito Canyon watershed has been as the canyon-bottom location for the Los Alamos Critical Experiments Laboratory at Technical Area (TA) 18 and for mesa-top surface and subsurface Material Disposal Areas (MDAs) F and Q at TA-06; MDA M at TA-09; and MDAs G, H, J, and L at TA-54. A detailed description and data summary for Pajarito Canyon potential contaminants is contained within the work plan for Pajarito Canyon (LANL 1998, 058820)

The technical areas located within this watershed include TA-03, -06, -07, -08, -09, -14, -15, -18, -22, -23, -27, -36, -40, -46, -50, -54, -55, -58, -59, -64, -65, -66, -67, and -69. The contaminant release history from approximately 379 solid waste management units (SWMUs) and areas of concern (AOCs) includes releases or possible releases from outfalls, septic systems, spills, open detonations from firing sites, and MDAs. Laboratory-related contamination has been detected in Pajarito Canyon water samples obtained

from perennial and ephemeral streams, alluvial groundwater, and springs supplied by intermediate groundwater from the Bandelier Tuff.

Other uses within the watershed area include surface and subsurface MDAs and a buffer zone for mesa-top firing activities. To a lesser extent, the canyon has been used for liquid waste disposal. The early discharges were associated with outfalls, surface runoff, and dispersion from firing sites located at TA-06, -07, -08, -09, -12 (former), -15, -18, -22, -27 (former), and -69. Additional discharges began with the continued expansion of Laboratory operations to new sites from the 1950s to the 1970s, specifically TA-03, -36, -40, -48, and -59. Discharges to Pajarito Canyon and its tributaries have decreased as fewer firing sites within the watershed remain active during the past decades, and many outfalls have either been rendered inactive or rerouted to the Laboratory's sanitary waste treatment facility at TA-46 during the 1980s and 1990s.

1.2 Conceptual Model

The conceptual model for the Pajarito Watershed as provided in the IFGMP is reproduced in Appendix A of this document.

2.0 SCOPE OF ACTIVITIES

The PMEs for the Pajarito Watershed were conducted pursuant to the 2006 IFGMP.

Tables 2.0-1 through 2.0-3 provide the location name, sample collection date, port name, port depth, screened interval, top and bottom screen depths, base flow or water level, and the water-level method for each of the monitored locations. These locations are shown in Figure 2.0-1.

3.0 MONITORING RESULTS

3.1 Methods and Procedures

All methods and procedures used to perform the field activities associated with the PMEs are documented in the 2006 IFGMP.

3.2 Field Parameter Results

Tables B-1 through B-3 (Appendix B) contain the field parameter results for the PMEs and the three PMEs immediately before the December 2006 sampling event.

3.3 Water-Level Observations

The periodic monitoring water-level data for these events and the previous three monitoring events are located in Tables C-1 through C-3 (Appendix C). For wells equipped with transducers, the reported water level is the water-level measurement taken earliest on the day of sampling. All manual measurements are reported at the time immediately before sampling. The water-level measurements taken during these periodic monitoring events are shown graphically in Figures 3.3-1 through 3.3-3.

3.4 Deviations from Planned Scope

Tables 3.4-1 through 3.4-3 describe the deviations from the planned scope of the PMEs.

4.0 ANALYTICAL DATA RESULTS

4.1 Methods and Procedures

All methods and procedures used to perform the analytical activities of the PMEs are documented in the 2006 IFGMP.

4.2 Analytical Data

Appendix D presents the analytical data from the PMEs and from the three sampling events before December 2006. The regulatory standards to which the results are compared are shown in Table 4.2-1. The analytical laboratory reports (including chains of custody, etc.) can be found in Appendix G.

Appendix D contains all data obtained during the PMEs (that is, all data that have been independently reviewed for conformance with Laboratory requirements), with the following constraints.

- All data
    - Data that are R qualified (rejected because of noncompliance regarding quality control [QC] acceptance criteria) during independent validation are considered "not detected" but are still reported. Analytical laboratory QC results, including matrix spike and matrix spike duplicates, are not included in the data set.
- Radionuclides
    - All low-detection-limit tritium data are reported. Results greater than 3 times the 1 standard deviation total propagated analytical uncertainty (or 3σ) are considered to be detections.
    - Americium-241 and uranium-235 are reported only by chemical separation alpha spectroscopy. No gamma spectroscopy results are presented for these analytes.
    - Only cesium-137, colbalt-60, neptunium-237, potassium-40, and sodium-22 are reported (or analyzed) for the gamma spectroscopy suite.
    - Otherwise, all detections are reported at all locations (that is, results without a laboratory qualifier of U or X (abbreviations that indicate the analyte was not detected).
- Nonradionuclides
    - All results, excluding nondetections, are reported. Field duplicates, reanalyses, field blanks, trip blanks, equipment blanks, and different analytical methods are also reported.

The standards applied to all surface-water and groundwater data are listed in Table 4.2-1. Table 4.2-1 indicates the type of standard and the agency that promulgated the standard.

Data for PMRs are evaluated using the following screening process.

- Surface-water and groundwater perchlorate data were compared with the screening level of 4 µg/L established in Section VIII.A.1.a of the Consent Order. Surface-water sample results were compared with all surface-water standards without consideration of the designated use for the particular reach. The New Mexico Water Quality Control Commission (NMWQCC) groundwater standards apply to the dissolved (filtered) portion of specified contaminants; however, the standards for mercury, organic compounds, and nonaqueous phase liquids apply to the total unfiltered concentrations of the contaminants.

- As required by the Consent Order, U.S. Environmental Protection Agency (EPA) Region 6 tap water screening levels are used for constituents having no other regulatory standard and for which toxicological information is published. For these screening levels, the tables indicate a risk type of C-5 (excess cancer risk level of 10^{-5}) or N (noncancer). The Consent Order specifies screening for excess cancer risk at a risk level of 10^{-5} (rather than 10^{-6} as given in the Region 6 tables). Therefore, the Region 6 values were multiplied by 10 to obtain the 10^{-5} excess cancer risk level. The analytical results for radioactivity are compared with the DOE Biota Concentration Guides (BCGs) for surface water and Derived Concentration Guidelines (DCGs) for groundwater.

- Tables E.1-1 through E.3-8 (Appendix E) show all values for perchlorate, radioactivity, and organic compounds and all values greater than half the lowest applicable standard for metals and general inorganic compounds.

Analytical results are presented graphically in Figures 4.2-1 through 4.2-3. The figures contain diagrams displaying a series of select analytes around the circumference and showing the concentration by the length of the radius. An example of a diagram displaying metal concentrations is shown below.

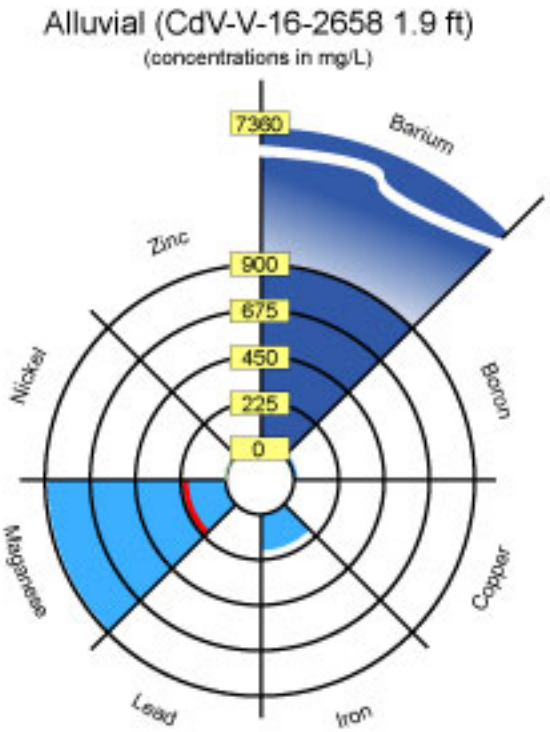

Figure 4.2-1 Metal concentrations

The analytes displayed in Figure 4.2-1 through 4.2-3 were selected from data acquired during the PMEs. Diagrams are shown for both groundwater and surface-water data. The analytes were chosen for display on the figures because of their historical presence in groundwater and surface water in this watershed.

Analytes that are not shown on the diagrams were either not detected or were radionuclides. The solid red lines, when shown, depict applicable regulatory standards or screening levels. A break in the diagrams' scale may be shown for certain analytes whose concentrations are considerably greater than

other measurements displayed on the figure. Note that some standards or screening levels may exceed the highest concentration displayed and may not appear on the diagram. Standards and screening-level values may be found in Tables E.1-1 through E.3-8 in Appendix E.

A summary of the results from comparing the groundwater and surface-water analytical data with regulatory standards is shown in Appendix E. Graphical representations of select groundwater and surface-water analytical results are shown in Figures 4.2-1 through 4.2-3.

Tables 4.2-2 through 4.2-4 give the number of surface-water and groundwater analytical results (by hydrogeologic zone for a specific analytical suite) that are above a standard or screening level. Multiple detections of a particular constituent at a location are counted as one result. For example, if aluminum is detected above a standard or screening level in both a primary sample and a field duplicate, the detection is counted as one result.

4.2.1 Surface Water (Base Flow)

4.2.1.1 December 4–December 20, 2006, PME

Surface-water perchlorate concentrations at all sample locations were below the Consent Order screening level of 4 µg/L. No general inorganic compound results for this PME exceeded regulatory standards.

Aluminum is the predominant metal present in surface water at concentrations above water-quality standards in watersheds across the Laboratory. The filtered aluminum concentration at one Pajarito Canyon surface-water location (Pajarito below confluences of South and North Anchor East Basin) was 4.8 times the New Mexico aquatic life chronic standard (at 100 mg hardness) of 87 µg/L and 0.56 times the New Mexico aquatic life acute standard (at 100 mg hardness) of 750 µg/L. The lower New Mexico aquatic life chronic standard applies in this upper perennial portion of Pajarito Canyon. The filtered aluminum concentration at the ephemeral location Pajarito 0.5 mi above State Highway 501 was below the New Mexico aquatic life acute standard.

No organic compounds were detected above standards or screening levels in surface-water samples. One compound, methylene chloride, was detected in a field trip blank.

Tritium results for two surface-water locations ranged from 31 to 50 pCi/L, which are similar to earlier results. Potassium-40 was detected at location Pajarito 0.5 mi above State Highway 501; the activity was just above the detection limit and was less than 1% of the New Mexico radiation protection standard (applicable to effluent) of 4000 pCi/L. No other radioactivity analytes were detected above screening thresholds at the four stations.

4.2.1.2 March 19–April 8, 2007, PME

Surface-water perchlorate concentrations at all sample locations were below the Consent Order screening level of 4 µg/L. No general inorganic compound results for this PME exceeded regulatory standards.

The filtered aluminum concentration at one Pajarito Canyon surface-water location (Pajarito below confluences of South and North Anchor East Basin) was 44 times the New Mexico aquatic life chronic standard (at 100 mg hardness) of 87 µg/L and 5 times the New Mexico aquatic life acute standard (at 100 mg hardness) of 750 µg/L. The lower New Mexico aquatic life chronic standard applies in this upper perennial portion of Pajarito Canyon. At this location, the filtered cadmium concentration near the detection limit was 55% of the New Mexico aquatic life chronic standard (at 100 mg hardness) of 0.2 µg/L.

The filtered aluminum concentrations at two ephemeral locations were above the New Mexico aquatic life acute standard, applicable in these reaches. At Pajarito 0.5 mi above State Highway 501 and Pajarito above Twomile, the concentrations were 2.4 times and 2.2 times the standard.

Bis(2-ethylhexyl)phthalate was detected at three surface-water stations, all at values near the detection limit, at about 10% of the New Mexico human health criterion of 22 µg/L.

Tritium results for five surface-water locations ranged from 48 to 85 pCi/L, similar to earlier results. Plutonium-238 and plutonium-239/240 were detected in unfiltered samples taken at Pajarito above Twomile. These analytes were not detected in filtered samples taken on the same date and have not been found in other base flow or snowmelt samples taken there. Plutonium has been detected in several runoff samples collected at this location. No other radioactivity analytes were detected above screening thresholds at the four stations.

4.2.1.3 June 25–July 15, 2007, PME

Surface-water perchlorate concentrations at all sample locations were below the Consent Order screening level of 4 µg/L. No general inorganic compound results for this PME exceeded regulatory standards.

The filtered aluminum concentration at one Pajarito Canyon surface-water location (Pajarito below confluences of South and North Anchor East Basin) was 6.1 times the New Mexico aquatic life chronic standard of 87 µg/L and 72% of the New Mexico aquatic life acute standard of 750 µg/L. The lower New Mexico aquatic life chronic standard applies in this upper perennial portion of Pajarito Canyon.

The filtered aluminum concentrations at one ephemeral location (Pajarito above Twomile) was three times the New Mexico aquatic life acute standard of 750 µg/L, applicable in that reach. A duplicate sample result was below the standard, however (114 µg/L vs. 2320 µg/L).

At Pajarito above Twomile, the polychlorinated biphenyl (PCB) Aroclor 1260 was found just above the detection limit at 0.046 µg/L. This result is 3.3 times the 0.014 µg/L New Mexico wildlife habitat standard and 72 times the 6.4×10^{-4} µg/L New Mexico human health criterion. This is the first detection of a PCB compound in surface water at this location, and it was not detected in a field duplicate.

No radioactivity analytes were detected above screening thresholds at these stations.

4.2.2 Groundwater

4.2.2.1 December 4–December 20, 2006, PME

Groundwater perchlorate concentrations at all locations were below the Consent Order screening level of 4 µg/L. The chloride and total dissolved solids (TDS) results at alluvial well PCO-3 were 115% and 85% of the NMWQCC groundwater standard (applicable to domestic water supply) of 250 mg/L and 1000 mg/L. No other general inorganic compound results exceeded regulatory standards.

The filtered aluminum, iron, and manganese results at several springs and wells in Pajarito Canyon were between 93% and 790% of the respective NMWQCC groundwater standards (applicable to irrigation use or domestic water supply) of 5000 µg/L, 1000 µg/L, and 200 µg/L. The highest value relative to standards was for manganese at regional aquifer well R-32 at 976 ft.

Several organic compounds were found in groundwater and QC samples with a few found near or above standards or screening levels in intermediate groundwater. The diesel range organic analyte, several

chlorinated solvents, dioxane, and chloroform were detected at two intermediate wells at TA-03 (03-B 10 and 03-B-13), as in prior samples. Dioxane[1,4-] was detected (based on the semivolatile method, which is more precise than the volatile method) at 03-B-10 and 03-B-13 at 63% and 125%, respectively, of the EPA tap water 10^{-5} excess cancer risk screening level of 61.1 µg/L. Trichloroethane[1,1,1-] concentrations at these wells were 233% and 187%, respectively, of the NMWQCC groundwater standard of 60 µg/L. Trichloroethene concentrations at these wells were 48% and 37%, respectively, of the EPA maximum contaminant level (MCL) for drinking water of 5 µg/L.

Several high explosives (HE) compounds were present in samples at intermediate groundwater locations Keiling Spring and Bulldog Spring, as in the past. At regional well R-18, hexahydro-1,3,5-trinitro-1,3,5-triazine (RDX) was found at a concentration just above the MDL, at 3% of the EPA tap water 10^{-5} excess cancer risk screening level of 6.1 µg/L. This is the second sample event (of four total) where RDX was detected in this well. In the August 2006 sample, RDX was detected in a sample but was not detected in the field duplicate. The compound 2,6-diamino-4-nitrotoluene was detected for the first time at R-18.

Plutonium-239/240 was found just above the detection limit in a sample at alluvial well 18-MW-11 but was not detected in the unfiltered sample. Plutonium-239/240 was also detected just above the detection limit in two of five samples from Homestead Spring in Pajarito Canyon—a field blank and unfiltered field duplicate—but was not detected in the filtered field duplicate and the other unfiltered and filtered samples.

For Pajarito Canyon alluvial well PCO-3, the unfiltered uranium result (5.3 µg/L at 18% of the NMWQCC groundwater standard of 30 µg/L) is the first measurement since 2005. Strontium-90 was also detected in PCO-3 (0.65 pCi/L, or 8% of the 8 pCi/L MCL in an unfiltered sample and also in the filtered sample). This is the first strontium-90 result since 1998 other than samples collected in 2001 and 2005. Strontium-90 was detected in 2005 at the current value.

Strontium-90 was detected in the unfiltered but not filtered sample at Keiling Spring in upper Pajarito Canyon (0.6 pCi/L, or 8% of the MCL), the first detect in four sample rounds. Potassium-40 was also detected in a field blank taken at this location; the activity was just above the detection limit.

Tritium detections at the two SM-30 wells 03-B-10 and 03-B-13 (217 pCi/L and 445 pCi/L) are in the range of earlier values. Tritium activities in alluvial groundwater wells ranged up to 82 pCi/L. In intermediate springs, the tritium range was from 2 to 76 pCi/L. In regional aquifer wells, the highest tritium value detected was 7.8 pCi/L in R-22 at 1448 ft; results for tritium from R-19 were all nondetections.

4.2.2.2 March 19–April 8 2007, PME

Groundwater perchlorate concentrations at all locations were below the Consent Order screening level of 4 µg/L. The chloride results at intermediate wells 03-B-10 and 03-B-13 were 166% and 155% of the NMWQCC groundwater standard (applicable to domestic water supply) of 250 mg/L. The chloride results at alluvial wells 18-MW-18, PCO-2, and PCO-3 ranged from 51% to 80% of the standard. TDS results at four of the alluvial wells ranged from 52% to 82% of the NMWQCC groundwater standard (applicable to domestic water supply) of 1000 mg/L.

The filtered aluminum, iron, and manganese results at several springs and wells in Pajarito Canyon were up to 750% of the respective NMWQCC groundwater standards (applicable to irrigation use or domestic water supply) of 5000 µg/L, 1000 µg/L, and 200 µg/L. The highest values relative to standards were for iron at Keiling Spring (at 672% of the standard) and manganese at regional aquifer well R-32 at 976 ft (at 750% of the standard).

An unfiltered mercury result at alluvial well PCO-3 was 90% of the NMWQCC groundwater standard of 2 µg/L. The result of 1.8 µg/L is the first measurement above one-half the NMWQCC groundwater standard (which applies to total mercury). Mercury has been detected four times at this well, out of 13 samples since 1985. The prior mercury concentrations ranged from 0.2 to 0.3 µg/L.

Several organic compounds were found in groundwater and QC samples, with a few found near or above standards or screening levels in intermediate groundwater. Six polycyclic aromatic hydrocarbons (PAHs) were detected for the first time at Anderson Spring in Pajarito Canyon in April 2007 in the third measurement for these compounds. One compound, benzo(a)pyrene, was at a concentration 1.7 times the EPA MCL. Three other PAHs were above the EPA tap water screening levels. Benzo(b)fluoranthene, dibenz(a,h)anthracene, and indeno(1,2,3-cd)pyrene are at 1.0, 107, and 9.1 times, repectively, of the 10^{-5} excess cancer risk for the EPA Region 6 tap water screening levels.

The diesel range organic analyte, several chlorinated solvents, dioxane, and chloroform were detected at two intermediate wells at TA-03 (03-B-10 and 03-B-13), as in prior samples. Dioxane[1,4-] was detected (based on the semivolatile method, which is more precise than the volatile method) at 03-B-10 and 03-B-13 at 119% and 54%, respectively, of the EPA tap water 10^{-5} excess cancer risk screening level of 61.1 µg/L. Trichloroethane[1,1,1-] concentrations at these wells were 135% and 235%, respectively, of the NMWQCC groundwater standard of 60 µg/L. Trichloroethene concentrations at these wells were 25% and 35%, respectively, of the EPA MCL for drinking water of 5 µg/L.

Several HE compounds were present in samples at intermediate groundwater locations Keiling Spring and Bulldog Spring, as in the past. RDX was found in a sample at regional well R-18 at a concentration just above the MDL, at 3% of the EPA tap water 10^{-5} excess cancer risk screening level of 6.1 µg/L. This is the third sample event (of five total events) where RDX was detected in this well.

The first detection of americium-241 in a filtered sample from Pajarito Canyon regional well R-18 was reported. However, only one of four analyses from this sampling event (including an unfiltered sample and a filtered and unfiltered field duplicate) produced a detection, and a reanalysis of the sample was a nondetection. Seven monitoring events for americium-241 have occurred at this location, with no prior detections.

Strontium-90 and tritium were detected at two intermediate wells at TA-03 (03-B-10 and 03-B-13), as in prior samples. Gross beta was measured in filtered samples at 58% and 142% of the EPA drinking water screening level of 50 pCi/L at Charlie's Spring and R-22, 1273 feet, respectively. The unfiltered companion sample at Charlie's Spring was 110% of the EPA screening level. Gross beta activity was the highest result by an order of magnitude at both locations.

Tritium activities in alluvial groundwater wells ranged up to 94 pCi/L. In intermediate springs the tritium range was from 50 to 122 pCi/L. In regional aquifer wells, the highest tritium value detected was 8 pCi/L in R-22 at 1448 ft. Results for tritium from other regional aquifer wells were nondetections, or upon reanalysis, near the detection limit.

4.2.2.3 June 25–July 15, 2007, PME

Groundwater perchlorate concentrations at all locations were below the Consent Order screening level of 4 µg/L. The chloride result at intermediate well 03-B-9 was 140% of the NMWQCC groundwater standard (applicable to domestic water supply) of 250 mg/L. The TDS result at this well was 94% of the NMWQCC groundwater standard (applicable to domestic water supply) of 1000 mg/L.

The filtered iron and manganese results at TA-18 Spring, 03-B-9, and R-32 in Pajarito Canyon were above the respective NMWQCC groundwater standards (applicable to domestic water supply) of 1000 µg/L and 200 µg/L. The highest values relative to standards were for iron at TA-18 Spring (at 169% of the standard) and manganese at intermediate well 03-B-9 (at 725% of the standard).

Several organic compounds were found in groundwater and QC samples with a few found near or above standards or screening levels in intermediate groundwater.

The diesel range organic analyte, several chlorinated solvents, dioxane, and chloroform were detected at intermediate wells at TA-03 (03-B-9, 03-B-10, and 03-B-13), as in prior samples. Dioxane[1,4-] was detected (based on the semivolatile method, which is more precise than the volatile method) at 03-B-10 and 03-B-13 at 167% and 239%, respectively, of the EPA tap water 10^{-5} excess cancer risk screening level of 61.1 µg/L. Results for dioxane[1,4-] by the volatile method in these wells and in 03-B-9 were higher. Trichloroethane[1,1,1-] concentrations at these wells ranged from 173% to 343% of the NMWQCC groundwater standard of 60 µg/L. Trichloroethene concentrations at these wells ranged from 22% to 40% of the EPA MCL for drinking water of 5 µg/L. Dichloroethene[1,1-] concentrations ranged from 40% to 159% of the EPA MCL for drinking water of 7 µg/L.

Several HE compounds were present in samples at intermediate groundwater location Bulldog Spring, as in the past. RDX was found in a sample at regional well R-18 at a concentration just above the MDL, at 4% of the EPA tap water 10^{-5} excess cancer risk screening level of 6.1 µg/L. This is the fourth sample event (of six total events) where RDX was detected in this well. At R-18, 2,4-diamino-6-nitrotoluene was also detected (near the detection limit) but was only found in one of a pair of duplicated samples.

The PCB Aroclor 1260 was detected at TA-18 Spring and alluvial well 18-BG-1. Both results were near the detection limit, and at TA-18 Spring the compound was found in only one of a pair of duplicate samples. These are the first PCB detections at either of these locations.

Strontium-90 was found in a filtered sample at alluvial well PCO-2. Tritium was detected at three intermediate wells at TA-03; at 03-B-10 and 03-B-13 the values were similar to prior samples. The other well, 03-B-9, was sampled for the first time. A detection of plutonium-238 at 03-B-10 is the first from five sample rounds at this well. The result was just above the detection limit.

4.3 Sampling Program Modifications

No modifications to the periodic monitoring sampling for the Pajarito Watershed are proposed at this time.

5.0 INVESTIGATION-DERIVED WASTE

Appendix F discusses the management of wastes produced during the PMEs and contains the waste management records for waste streams generated during these sampling events.

6.0 SUMMARY AND INTERPRETATIONS

6.1 Monitoring Results

An evaluation of the field parameter monitoring results presented in Tables B-1 through B-3 (Appendix B) and subsequent monitoring events will be provided in the annual update to the IFGMP.

6.2 Analytical Results

6.2.1 Surface Water (Base Flow)

The types of contaminants detected in surface water and their concentrations are consistent between sampling events for these PMEs and also with previous data.

6.2.1.1 December 4–December 20, 2006, PME

One surface-water sample, which was collected during this PME from Pajarito Canyon, exceeded regulatory standards or screening levels.

6.2.1.2 March 19–April 8, 2007, PME

Three surface-water samples, which were collected during this PME from Pajarito Canyon, exceeded regulatory standards or screening levels.

6.2.1.3 June 25–July 15, 2007, PME

Three constituents in surface-water samples, which were collected during this PME from Pajarito Canyon, exceeded regulatory standards or screening levels.

6.2.2 Groundwater

The types of contaminants detected in groundwater and their concentrations are consistent between sampling events for these PMEs and also with previous data.

6.2.2.1 December 4–December 20, 2006, PME

Twelve groundwater samples, which were collected during this PME from Pajarito Canyon, exceeded regulatory standards or screening levels.

6.2.2.2 March 19–April 8, 2007, PME

Twenty-one groundwater samples, which were collected during this PME from Pajarito Canyon, exceeded regulatory standards or screening levels.

6.2.2.3 June 25–July 15, 2007, PME

Eleven constituents in groundwater samples, which were collected during this PME from Pajarito Canyon, exceeded regulatory standards or screening levels.

6.3 Data Gaps

A summary of the field parameter gaps encountered during the PMEs may be found in Tables 3.4-1 through 3.4-3. The tables provide a detailed account of sampling event deviations.

7.0 REFERENCES

The following list includes all documents cited in this report. Parenthetical information following each reference provides the author(s), publication date, and ER ID number. This information is also included in text citations. ER ID numbers are assigned by the Environmental Programs Directorate's Records Processing Facility (RPF) and are used to locate the document at the RPF and, where applicable in the Program master reference set.

Copies of the master reference set are maintained at the NMED Hazardous Waste Bureau; the U.S. Department of Energy–Los Alamos Site Office; the U.S. Environmental Protection Agency, Region 6; and the Directorate. The set was developed to ensure that the administrative authority has all material needed to review this document, and it is updated with every document submitted to the administrative authority. Documents previously submitted to the administrative authority are not included.

Table 3.4-1
Observations and Deviations
December 4–December 20, 2006, PME

Location	Deviation	Cause	Comment
03-B-9	No data are included in this report for this location.	The location was not sampled on 12/14/06 because it was dry.	Location will be sampled if sufficient water is present during next scheduled sampling round.
18-BG-4	No data are included in this report for this location.	The location was not sampled on 12/12/06 because it was dry.	Location will be sampled if sufficient water is present during next scheduled sampling round.
PCO-2	No data are included in this report for this location.	The location was not sampled on 12/13/06 because it was dry.	Location will be sampled if sufficient water is present during next scheduled sampling round.
Pajarito above Twomile, Pajarito below TA-18, TA-18 Spring, Threemile Spring	No data are included in this report for these locations.	The locations were not sampled on 12/4/06 because they were frozen.	Locations will be sampled during next scheduled sampling round.
R-19, Screen 1	No data are included in this report for this location.	The location was not sampled on 12/11/06 because it was dry.	Location will be sampled if sufficient water is present during next scheduled sampling round.
R-20	No data are included in this report for this location	The location was not sampled because no sampling system was installed	Location will be sampled after sampling system is installed.
R-23i	No data are included in this report for this location.	The location was not sampled on 12/7/06 because the pump was not installed.	Location will be sampled after pump is installed.
Two Mile Canyon below TA-59, Twomile above Pajarito	No data are included in this report for these locations.	The locations were not sampled on 12/9/06 because they were frozen.	Locations will be sampled if sufficient water is present during next scheduled sampling round.

Table 3.4-2
Observations and Deviations
March 19–April 8, 2007

Location	Deviation	Cause	Comment
03-B-9	No data are included in this report for this location.	The location was not sampled on 3/27/07 because of surface water contamination.	Location will be checked again during next scheduled sampling round.
18-BG-4, Pajarito below TA-18	No data are included in this report for these locations.	The locations were not sampled on 3/19/06 because they were dry.	Locations will be sampled if sufficient water is present during next scheduled sampling round.
PCO-2	No data are included in this report for this location.	The location was sampled for limited analytical suites because the well went dry during sampling on 3/20/07.	Location will be sampled if sufficient water is present during next scheduled sampling round.
R-23i	No data are included in this report for these locations.	The locations were not sampled because the wells are now on the characterization schedule.	Locations will be sampled during next PME.
R-19, Screen 1	No data are included in this report for this location.	The location was not sampled on 4/2/07 because it was dry.	Location will be sampled if sufficient water is present during next scheduled sampling round.
R-20	No data are included in this report for this location.	The location was not sampled because no sampling system was installed.	Location will be sampled after sampling system is installed.
TW-1.72 Spring	No data are included in this report for this location.	The location was not sampled on 3/27/07 because it was dry.	Location will be sampled if sufficient water is present during the next scheduled sampling round.

Table 3.4-3
Observations and Deviations
June 25–July 15, 2007 PME

Location	Deviation	Cause	Comment
03-B-9	SVOC, HE, and radionuclides are not included in this report.	The location was sampled for limited analytical suites on 7/11/07 because the well purged dry.	Location will be sampled again during next scheduled sampling round.
18-BG-4, Threemile Spring	No data are included in this report for these locations.	The locations were not sampled on 6/26/07 because they were dry.	Locations will be sampled if sufficient water is present during next scheduled sampling round.
PCO-3, R-19 Screen 1	No data are included in this report for these locations.	The locations were not sampled on 7/2/07 because they were dry.	Locations will be sampled if sufficient water is present during next scheduled sampling round.
Pajarito below TA-18	No data are included in this report for this location.	The location was not sampled on 6/27/07 because it was dry.	Locations will be sampled if sufficient water is present during next scheduled sampling round.
R-20	No data are included in this report for this location.	The location was not sampled because no sampling system was installed.	Location will be sampled after sampling system is installed.
R-23i	No data are included in this report for this location.	The location was not sampled because well is now on the characterization schedule.	Location will be sampled during next PME.
TW-1.72 Spring	No data are included in this report for this location.	The location was not sampled on 7/11/07 because it was dry.	Location will be sampled if sufficient water is present during next scheduled sampling round.

Appendix A

Pajarito Watershed Conceptual Model

This appendix contains the conceptual model as described in Table A-3 of the "2006 Interim Facility-Wide Groundwater Monitoring Plan" (LANL 2006, 094043).

Conceptual Model Element	Characteristic	Pajarito Canyon	Twomile Canyon	Threemile Canyon
Surface Water	Flow	Surface water occurs in Pajarito Canyon mostly as intermittent flow. Short reaches of perennial flow occur downstream of spring discharges in Starmer's Gulch and below the 4-series springs in White Rock Canyon. Surface-water flow is ephemeral in central Pajarito Canyon between the confluences with Twomile and Threemile Canyons. Flow is also ephemeral through White Rock.	Flow is ephemeral west of Technical Area (TA) 03 and is possibly intermittent from TA-03 to the confluence with Pajarito Canyon.	Threemile Canyon is ephemeral, except for a possibly intermittent reach supported by springs above the confluence of Threemile and Pajarito Canyons.
	Quality	Key contaminants include hexahydro-1,3,5-trinitro-1,3,5-triazine (RDX) and possibly mercury and nitrate.	There are no surface-water chemistry results for Twomile Canyon except for a small tributary below building SM-30 in TA-03. Samples from the tributary show elevated mercury in unfiltered samples.	Contaminants include RDX.
Springs	Flow	In the western portion of Pajarito Canyon, springs issue from canyon slopes above the alluvium. The probable source of these springs is the upper part of the Tshirege Member of the Bandelier Tuff. Typical discharge rates are approximately 1 to 15 gal./min. PC, Homestead, Upper Starmer, Charlies, Garvey, Perkins, Starmer, Josie, Keiling, and Bulldog Springs are included.	Springs issue from the canyon floor of upper Twomile Canyon in TA-03 and 58, including Hanlon, Anderson, SM-30, SM-30A, and TW-1.72 Springs.	There are two springs on the floor of Threemile Canyon: Threemile and TA-18 Springs.
	Quality	Contaminants include RDX and perchlorate, which have been detected in spring water at TA-08 and TA-09.	There are no screening data for springs in Twomile Canyon.	No contaminants exceed regulatory standards.

Conceptual Model Element	Characteristic	Pajarito Canyon	Twomile Canyon	Threemile Canyon
Alluvial Groundwater	Extent/Hydrology	There are no alluvial wells in western Pajarito Canyon, so information about the nature and extent of alluvial groundwater is limited. Most likely, infiltration of surface water creates a saturated zone where alluvium is present from the Pajarito fault zone across Los Alamos National Laboratory (Laboratory) to White Rock. Alluvial wells have been installed between TA-18 and State Highway 4. These wells demonstrate the presence of alluvial groundwater in this part of Pajarito Canyon. The drilling of seven test holes in 1985 showed that the saturation in lower Pajarito Canyon does not extend laterally under Mesita del Buey near Material Disposal Areas G and L (Devaurs 1985, 007416; Devaurs and Purtymun 1985, 007415). Three of the alluvial test holes were completed as groundwater-monitoring wells (PCO-1, -2, and -3). An additional 20 alluvial wells were installed between 1990 and 1998 by the Environmental Restoration Project as part of the Resource Conservation and Recovery Act facility investigation for TA-18.	There are no alluvial wells in Twomile Canyon, and the extent of alluvial groundwater, if present, is unknown.	Alluvial groundwater has been documented in lower Threemile Canyon at 18-BG-1 and 18-MW-8.
	Depth/Thickness	Wells PCO-1, -2, and -3 are probably representative of alluvial groundwater between TA-18 and State Highway 4. When they were installed, depth to water was 1.3 ft in PCO-1, 6.3 ft in PCO-2, and 3.1 ft in PCO-3 (Purtymun 1995, 045344). Assuming continuous saturation in the alluvium, it was concluded that the saturated thickness is about 9.7 ft in PCO-1, 2.7 ft in PCO-2, and 8.9 ft in PCO-3. The saturated thickness varies seasonally, with no water present in dry years.	No data	In well 18-BG-4, the water level was 2.5 ft below ground surface.
	Quality	Contaminants include RDX and possibly beryllium, lead, and plutonium-239/240.	No data	No contaminants exceed regulatory standards.

Conceptual Model Element	Characteristic	Pajarito Canyon	Twomile Canyon	Threemile Canyon
Intermediate Groundwater	Extent/ Hydrology	Intermediate perched water is likely to occur beneath Pajarito Canyon, but knowledge of its extent and quality is incomplete. Perched water was indicated during the drilling of PM-2 and SHB-4 in the vicinity of TA-18. At PM-2, a "show of water at 335 ft" was noted in the Otowi Member of the Bandelier Tuff during the cable-tool drilling (Cooper et al. 1965, 008582). In SHB-4, the core tube and core from the top of the Otowi Member from about 125 ft to 145 ft came out of the hole wet (Gardner et al. 1993, 012582). Test Holes 5 and 6 were drilled in 1950 to detect perched groundwater in Pajarito Canyon south of TA-54. Test Hole 5 was drilled through the Bandelier Tuff and into basalts at a total depth of 263 ft. Test Hole 6 was also drilled through the tuff and into basalts to a total depth of 300 ft (Griggs and Hem 1964, 092516). These dry test holes indicate that perched water does not occur in the upper part of the vadose zone in this part of the canyon. Between 2000 and 2002, regional wells R-20, R-22, R-23, and R-32 were installed in lower Pajarito Canyon. Perched intermediate water was not identified during the drilling of wells R-20, R-22, and R-32. However, at R-23, near the eastern Laboratory boundary, there were indications that perched intermediate water may be present in Cerros del Rio basalt. However, R-23 is only screened in the regional aquifer.	Well 03-MW-1 is a 28-ft-deep mesa-top well that samples shallow intermediate perched water near building SM-30 at TA-03. A thin zone of saturation occurs in tuffs of the upper Tshirege Member.	Characterization well R-19, located on the mesa south of Threemile Canyon, had indications of possible perched water at depths of 834 to 840 ft and 894 to 912 ft (Broxton et al. 2001, 071254). Both zones were screened in the completed well, but only the 894- to 912-ft interval (screen 2) in the Puye Formation yields water.
	Depth/Thickness	See above.	Depth to water in well 03-MW-1 is 20 ft.	See above.

Conceptual Model Element	Characteristic	Pajarito Canyon	Twomile Canyon	Threemile Canyon
Intermediate Groundwater (continued)	Quality	No data	Characterization sampling for 03-MW-1 found elevated concentrations of mercury, tritium, and volatile organic compounds (VOCs). A groundwater investigation work plan is being prepared to determine the extent of this perched zone.	No contaminants exceed regulatory standards. Samples from well R-19 indicate there are impacts to the intermediate perched water from Laboratory operations.
Regional Aquifer	Depth/ Hydrology	Based on Laboratory water-level maps, the general direction of groundwater flow in the regional aquifer is east to southeast in the vicinity of Pajarito Canyon. Depth to the regional aquifer is known in Pajarito Canyon at supply well PM-2 and in characterization wells R-20, R-22, R-23, and R-32. The nonpumping water level for PM-2 in 2001 was at a depth of 855 ft. In 2002, the top of the regional water table was at a depth of 826 ft in R-20, 890 ft in R-22, 828 ft in R-23, and 776 ft in R-32. R-23 is completed with a single well screen; R-20 and R-32 have three well screens; and R-22 has five well screens. The upper portion of the regional aquifer probably discharges at Spring 4A in White Rock Canyon.	No regional aquifer wells are associated with Twomile Canyon.	Well R-19 is located on the mesa south of Threemile Canyon. It is downgradient of firing site IJ in TA-36 and upgradient of TA-18. In addition to two screens in the vadose zone (described above), R-19 has five screens in the regional aquifer.
	Quality	No contaminants exceed regulatory standards. Water quality of the regional aquifer beneath eastern Pajarito Canyon shows little, if any, impact from Laboratory operations. Sampling at R-22 shows levels above background tritium in several screens. Routine surveillance sampling of PM-2 shows the groundwater meets regulatory standards.	No data	No contaminants exceed regulatory standards. Sampling at R-19 indicates no impacts to the regional groundwater from Laboratory operations.
Contaminants	Potential Sources	TA-08, -09, -15, -22, -36, -36, -40, and -54	TA-03, -06, -40, -48, -55, -59, -64, and -69	TA-15, -18, and -36
	Type	Metals, radionuclides, high explosives, VOCs, and anions	Mercury, tritium, and VOCs	High explosives, VOCs

A.1-0 REFERENCES

The following list includes all documents cited in this appendix. Parenthetical information following each reference provides the author(s), publication date, and ER ID number. This information is also included in text citations. ER ID numbers are assigned by the Environmental Programs Directorate's Records Processing Facility (RPF) and are used to locate the document at the RPF and, where applicable, in the master reference set.

Copies of the master reference set are maintained at the NMED Hazardous Waste Bureau; the U.S. Department of Energy–Los Alamos Site Office; the U.S. Environmental Protection Agency, Region 6; and the Directorate. The set was developed to ensure that the administrative authority has all material needed to review this document, and it is updated with every document submitted to the administrative authority. Documents previously submitted to the administrative authority are not included.
