Periodic Monitoring Report for Water Canyon/ Cañon de Valle Watershed March 24–April 15, 2009

Los Alamos
NATIONAL LABORATORY
EST. 1943

Prepared by the Environmental Programs Directorate

Los Alamos National Laboratory, operated by Los Alamos National Security, LLC, for the U.S. Department of Energy under Contract No. DE-AC52-06NA25396, has prepared this document pursuant to the Compliance Order on Consent, signed March 1, 2005. The Compliance Order on Consent contains requirements for the investigation and cleanup, including corrective action, of contamination at Los Alamos National Laboratory. The U.S. government has rights to use, reproduce, and distribute this document. The public may copy and use this document without charge, provided that this notice and any statement of authorship are reproduced on all copies.

EXECUTIVE SUMMARY

This report provides the results of the periodic monitoring event (PME) conducted by Los Alamos National Laboratory in the Water Canyon/Cañon de Valle Watershed. The PME for Water Canyon/Cañon de Valle Watershed is conducted semiannually pursuant to the Interim Facility-Wide Groundwater Monitoring Plan, prepared under the Compliance Order on Consent.

The PME documented in this report occurred from March 24 to April 15, 2009, and included sampling of groundwater monitoring wells or well ports, springs, and base-flow stations. The report also includes data from the previous PME that were not reported because they had not been validated.

Water samples collected during this PME were analyzed for target analyte list metals, volatile organic compounds, semivolatile organic compounds, cyanide, pesticides, polychlorinated biphenyls, high explosives, radionuclides, low-level tritium, general inorganics, perchlorate, stable isotopes, and field parameters (alkalinity, dissolved oxygen, pH, specific conductance, temperature, and turbidity).

Concentrations of two surface-water samples of aluminum (Water above SR-501, and Between E252 and Water at Beta) collected from Water Canyon during this PME exceeded screening levels. Aluminum concentration exceeded screening levels in previously unreported data of a surface-water sample (Between E252 and Water at Beta) collected from Water Canyon.

Concentrations of the analytes iron, boron, barium, aluminum, nickel, lead, hexahydro-1,3,5-trinitro-1,3,5-triazine, tetrachloroethene, trichloroethene, or bis(2-ethylhexyl)phthalate in 23 groundwater samples collected from Water Canyon during this PME exceeded screening levels. Barium or boron concentrations exceeded screening levels in previously unreported data of groundwater samples collected from Water Canyon.

1.0 INTRODUCTION

This report provides documentation of semiannual groundwater and surface-water monitoring conducted by Los Alamos National Laboratory (LANL or the Laboratory) in the Water Canyon/Cañon de Valle Watershed pursuant to the Interim Facility-Wide Groundwater Monitoring Plan (IFGMP) (LANL 2008, 101897), prepared under the Compliance Order on Consent (Consent Order). The periodic monitoring event (PME) occurred from March 24 to April 15, 2009, and included sampling at groundwater monitoring wells or well ports, springs, and base-flow stations.

The Consent Order identifies New Mexico Water Quality Control Commission (NMWQCC) groundwater standards, including alternative abatement standards and U.S. Environmental Protection Agency (EPA) drinking water maximum contaminant levels (MCLs), as cleanup levels for groundwater when corrective action is implemented. NMWQCC groundwater standards, MCLs, and EPA tap water screening levels are used as screening levels for monitoring data and are provided in this report.

This report presents the following information:

- general background information on the watershed
- the watershed conceptual model
- field-measurement monitoring results
- water-quality monitoring results
- results of the screening analysis (comparing the PME results with screening levels and results from previous reports)
- a summary based on the data and the screening analysis

Information on radioactive materials and radionuclides, including the results of sampling and analysis of radioactive constituents, is voluntarily provided to the New Mexico Environment Department (NMED) in accordance with U.S. Department of Energy (DOE) policy.

1.1 Background

The Water Canyon/Cañon de Valle Watershed is located in the southern portion of the Laboratory and encompasses an area of approximately 19 mi^2 (31 km^2). The headwaters of the Water Canyon/Cañon de Valle Watershed are located in the Sierra de los Valles, near the western margin of the Pajarito Plateau. The discharge point of the watershed is located at the Rio Grande on the eastern edge of the plateau. The major canyons in the watershed include Water, Cañon de Valle, Potrillo, and Fence Canyons. There are also numerous smaller canyons and arroyos within the watershed. The watershed includes numerous springs, ephemeral and perennial surface water, and alluvial groundwater. Cañon de Valle is the main tributary to Water Canyon.

Tributaries that may contribute contamination to Water Canyon/Cañon de Valle include Indio, Fence, and Potrillo Canyons, which join Water Canyon on the eastern side of the Laboratory. The technical areas (TAs) located within this watershed include TA-08, TA-09, TA-11, TA-14, TA-15, TA-16, TA-28, TA-36, TA-37, TA-39, TA-49, TA-68, TA-70, and TA-71. This region of the Laboratory was used for weapons testing, explosives testing, and explosives production and received effluent from outfalls containing explosives compounds, metals, and volatile organic compounds (VOCs). Stormwater runoff from firing sites, open burn/open detonation units, surface disposal sites, solid waste management units (SWMUs), and areas of concern (AOCs) may have contributed to the contamination detected within the watershed.

The contaminants detected in soil, rock, and sediment samples obtained from various locations within the watershed during previous investigations include barium and other Resource Conservation and Recovery Act (RCRA) metals, explosives compounds, VOCs, and radionuclides (not addressed under the Consent Order).

Results of the TA-16-260 Outfall corrective measures study investigation (LANL 2003, 085531) showed the drainage channel below the outfall, the canyon bottom as well as surface water, alluvial groundwater, and deep perched groundwater are contaminated with explosives compounds, including hexahydro-1,3,5-trintro-1,3,5-triazine (RDX); 1,3,5,7-tetranitro-1,3,5,7-tetrazocine (HMX); 2,4,6-trinitrotoluene (TNT); and barium (LANL 2003, 085531). The barium contamination resulted from an explosive compound, Baratol, which is a mixture of $Ba(NO_3)_2$ and TNT.

1.2 Conceptual Model

The conceptual model for the Water Canyon/Cañon de Valle Watershed is presented in Appendix A of this document.

2.0 SCOPE OF ACTIVITIES

The PME for the Water Canyon/Cañon de Valle Watershed was conducted pursuant to the 2008 IFGMP.

Table 2.0-1 provides the location name, sample collection date, port name, port depth, screened interval, top and bottom screen depths, base flow, water level, and the water-level method for each of the monitored locations. These locations are shown in Figure 2.0-1.

3.0 MONITORING RESULTS

3.1 Methods and Procedures

All methods and procedures used to perform the field activities associated with this PME are documented in the 2008 IFGMP.

3.2 Field Parameter Results

Appendix B contains the field parameter results for this PME and the previous three PMEs.

3.3 Water-Level Observations

The periodic monitoring water-level data for this event and the previous three monitoring events are presented in Appendix C. For wells equipped with transducers, the reported water level is the water-level measurement taken earliest on the day of sampling. All manual measurements are reported at the time immediately before sampling. The water-level measurements taken during these PMEs are shown graphically in Figures 3.3-1 and 3.3-2.

3.4 Deviations from Planned Scope

Table 3.4-1 describes the deviations from the planned scope of the PME. Most deviations noted during this PME were because the sampling locations were dry.

4.0 ANALYTICAL DATA RESULTS

4.1 Methods and Procedures

All methods and procedures used to perform the analytical activities of the PME are documented in the 2008 IFGMP.

All sampling, data reviews, and data package validations were conducted using standard operating procedures (SOPs) that are part of a comprehensive quality assurance program. The quality program and procedures are available at http://www.lanl.gov/environment/all/qa.shtml. Completed chain-of-custody forms serve as an analytical request form and include the requester or owner, sample number, program code, date and time of sample collection, total number of bottles, list of analytes to be measured, bottle sizes, and preservatives for each analysis required.

The required analytical laboratory batch quality control (QC) is defined by the analytical method, the analytical statement of work, and generally accepted laboratory practices. The analytical laboratory assigns qualifiers to the data to indicate the quality of the analytical results. The laboratory batch QC is used in the secondary data-validation process to evaluate the quality of individual analytical results, evaluate the appropriateness of the analytical methodologies, and measure the routine performance of the analytical laboratory.

In addition to batch QC performed by laboratories, the Laboratory submitted field QC samples to test the overall sampling and analytical laboratory process and to spot-check for analytical problems. These results are used in secondary validation along with information provided by the analytical laboratory.

After the Laboratory receives the analytical laboratory data packages, the packages receive secondary validation by an independent contractor, Analytical Quality Associates, Inc. (AQA). AQA's reviews follow the guidelines set in the DOE model SOP for data validation, which includes reviewing the data quality and the documentation's correctness and completeness; verifying that holding times were met; and ensuring that analytical laboratory QC measures were applied, documented, and kept within contract requirements. As a result of secondary validation, a second set of qualifiers is assigned to the analytical results.

The Laboratory assigns detection status to the analytical result based on the analytical laboratory and secondary validation qualifiers. A "<" symbol indicates that based on the qualifiers the result was a nondetection.

4.2 Analytical Data

Table D-1 in Appendix D presents previously unreported analytical data. Table D-2 presents the analytical data from this PME and from the last three sampling events immediately before the March and April 2009 sampling event. The screening levels with which the results are compared are presented in Table 4.2-1. The analytical laboratory reports (including chain-of-custody forms, data validation, etc.) are presented in Appendix G.

Table D-2 contains all data collected during the PME (that is, all data that have been independently reviewed for conformance with Laboratory requirements), with the following constraints.

- All data
    - ❖ Data that are R-qualified (rejected because of noncompliance regarding QC acceptance criteria) during independent validation are considered "not detected" but are still reported. Analytical laboratory QC results, including matrix spike and matrix spike duplicates, are not included in the data set.

- Radionuclides
    - ❖ All low-detection-limit tritium data are reported. Results greater than 3 times the 1 standard deviation total propagated analytical uncertainty (or 3σ) are considered to be detections.
    - ❖ Americium-241 and uranium-235 are reported only by chemical separation alpha spectroscopy. No gamma spectroscopy results are presented for these analytes.
    - ❖ Only cesium-137, cobalt-60, neptunium-237, potassium-40, and sodium-22 are reported (or analyzed) for the gamma spectroscopy suite.
    - ❖ Otherwise, all detections are reported at all locations, that is, results without a laboratory qualifier of U or X (abbreviations that indicate that the analyte was not detected).
- Nonradionuclides
    - ❖ All results, excluding nondetections, are reported. Field duplicates, reanalyses, field blanks, trip blanks, equipment blanks, and different analytical methods are also reported.

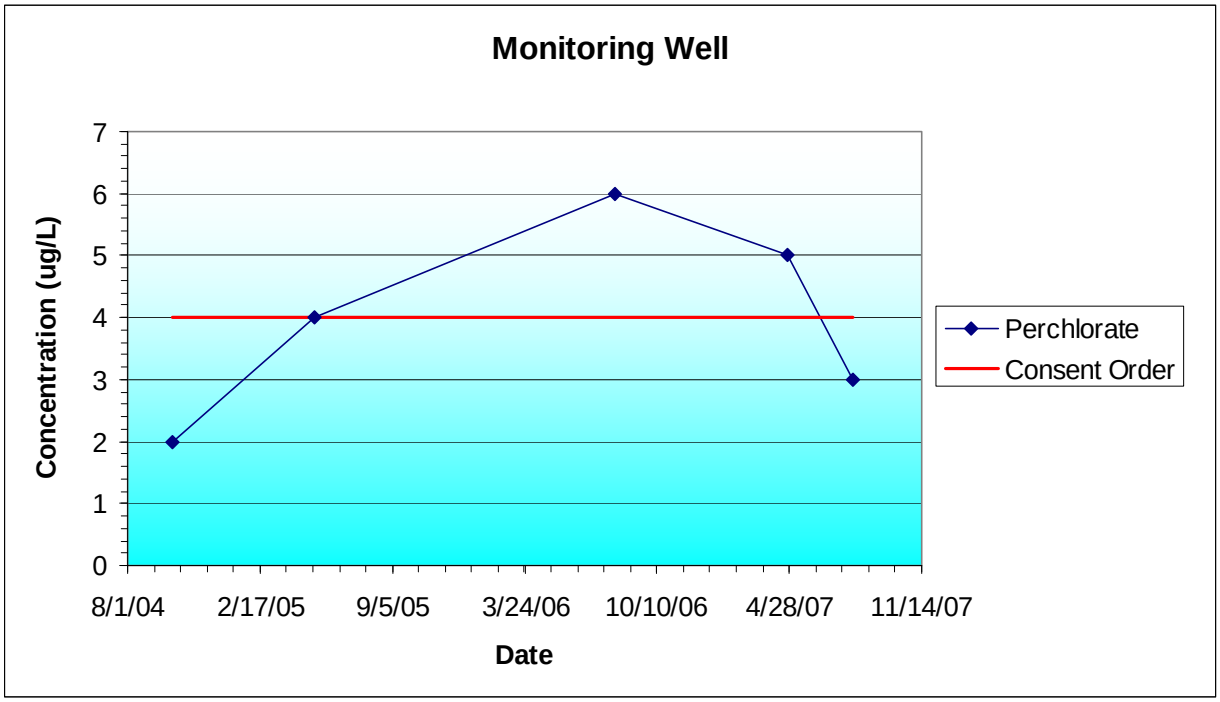

The screening levels applied to all media and their sources are listed in Table 4.2-1.

Data for periodic monitoring reports are evaluated using the following screening process.

- Surface-water and groundwater perchlorate data were compared with the screening level of 4 µg/L established in Section VIII.A.1.a of the Consent Order. Surface-water sampling results were compared with all surface-water standards without consideration of the designated use for the particular reach. The NMWQCC groundwater standards apply to the dissolved (filtered) portion of specified contaminants; however, the standards for mercury, organic compounds, and nonaqueous-phase liquids apply to the total unfiltered concentrations of the contaminants.
- As required by the Consent Order, EPA Region 6 tap water screening levels are used for constituents having no other regulatory standard and for which toxicological information is published. For these screening levels, the tables indicate a risk type of C (cancer) or N (noncancer). For the cancer-risk type, the risk levels are for 10^{-6} excess cancer risk. The Consent Order specifies screening with these values at a risk level of 10^{-5} (rather than 10^{-6}) excess cancer risk. Therefore, data must exceed the 10^{-6} screening values by a factor of 10 or more to be above a risk level of 10^{-5} excess cancer risk.
- The analytical results for radioactivity are compared with the DOE Biota Concentration Guide (BCG) for surface water and Derived Concentration Guidelines (DCGs) for groundwater.

Tables E-1 through E-8 (Appendix E) show all values for perchlorate, radioactivity, and organic compounds and all values greater than half the lowest applicable standard for metals and general inorganic compounds.

Analytical results are presented graphically in Figure 4.2-1. The figure contains diagrams displaying a series of select analytes. An example of a diagram displaying perchlorate concentration is shown below.

Perchlorate concentrations

The analytes shown in Figure 4.2-1 were selected from data collected during the PME. Diagrams for both groundwater and surface-water data are included. These analytes were chosen for display in the figures because of their historical presence in groundwater and surface water in this watershed.

Radionuclides are not shown on the diagrams. When shown, the solid red lines depict applicable regulatory standards or screening levels. Some screening levels may exceed the highest concentration displayed but may not appear on the diagram. Screening-level values may be found in Tables E-1 through E-8 in Appendix E.

A summary of the results from comparing the surface-water analytical data (including previously unreported data) with screening levels is shown in Tables E-1 through E-3 (Appendix E). Graphical representations of select surface-water analytical results are shown in Figure 4.2-1.

A summary of the results comparing the groundwater analytical data (including previously unreported data) with screening levels is presented in Tables E-4 through E-8 (Appendix E). Graphical representations of select groundwater analytical results are shown in Figure 4.2-1.

Table 4.2-2 gives the surface-water and groundwater analytical results (by hydrogeologic zone for a specific analytical suite) that are above a screening level. Multiple detections of a particular constituent at a location are counted as one result. For example, if aluminum is detected above a screening level in both a primary sample and a field duplicate, the detection is counted as one result. Therefore, only the highest result is shown in Table 4.2-2.

4.2.1 Surface Water (Base Flow)

Previously unreported results show filtered aluminum concentrations in surface water samples exceeded standards at one location. At location Between E252 and Water at Beta, the filtered aluminum

concentration (203 µg/L) was above the New Mexico aquatic life chronic standard of 87 µg/L; this standard applies in this perennial reach. Previous results measured since 2007 ranged from nondetect (<159 µg/L) to 1220 µg/L.

During this PME, filtered aluminum concentrations in surface water samples exceeded standards at two locations. At location Water above SR-501, the aluminum concentration (916 µg/L) was greater than the New Mexico aquatic life acute standard of 750 µg/L, which applies in this ephemeral reach. The recent results are in the range of results for previous snowmelt and surface-water samples collected since 2001: from nondetect (<52 µg/L) to 3510 µg/L.

At location Between E252 and Water at Beta, the filtered aluminum concentration (772 µg/L) was above the New Mexico aquatic life chronic standard of 87 µg/L, which applies in this perennial reach. Previous results measured since 2007 ranged from nondetect (<159 µg/L) to 1220 µg/L.

4.2.2 Groundwater

Previously unreported results show that filtered metal concentrations in two groundwater samples exceeded standards at two locations. The filtered barium concentration of 6470 µg/L at Cañon de Valle alluvial well CDV-16-02659 was above the NMWQCC groundwater standard of 1000 µg/L. Barium has been present at similar levels for 10 yr of sampling at this well. The filtered boron concentration (1230 µg/L) from intermediate groundwater location Martin Spring was above the 750 µg/L NMWQCC groundwater standard (for irrigation use). Samples collected at this location since 1995 show similar boron concentrations.

During this PME, the filtered barium concentrations at three Cañon de Valle alluvial wells (CDV-16-02656, CDV-16-02658, and CDV-16-02659 at 3260 µg/L, 5720 µg/L, and 5190 µg/L, respectively) were above the NMWQCC groundwater standard of 1000 µg/L. Barium has been present at similar levels for 10 yr of sampling at these wells.

Two alluvial wells (FLC-16-25278 and FLC-16-25280) in Fishladder Canyon had filtered iron results (3220 µg/L and 6830 µg/L, respectively) and aluminum results (5430 µg/L and11,900 µg/L, respectively) above their respective NMWQCC groundwater standards (respectively applicable to domestic water supply or irrigation use) of 1000 µg/L and 5000 µg/L. Each well has now been sampled two or three times for metals; filtered iron and aluminum results were above standards in previous samples.

The unfiltered lead concentration of 18.6 µg/L in a sample from Fishladder Canyon alluvial well FLC-16-25280 was above the 15 µg/L EPA drinking water system action level. The only previous sample, taken a year earlier, had an unfiltered lead concentration of 11.4 µg/L.

At two Cañon de Valle alluvial wells (CDV-16-02657 and CDV-16-02659), RDX (50.4 µg/L and15.4 µg/L, respectively) was found above the EPA tap water screening level of 6.1 µg/L. This result is consistent with variable concentrations measured at these wells during 10 yr of sampling.

The concentrations of tetrachloroethene (200 µg/L) and trichloroethene (10.9 µg/L) in a sample from Fishladder Canyon alluvial well FLC-16-25280 were above the 5 µg/L EPA MCLs that apply to each compound. The recent concentrations are similar to those from a 2008 sample. A 2006 sample had a considerably lower tetrachloroethene concentration of 6 µg/L.

The bis(2-ethylhexyl)phthalate concentration (6.58 µg/L) at Martin Spring Canyon alluvial well MSC-16-06293 was above the 6 µg/L EPA MCL. This compound was not detected in two earlier samples from the well.

The filtered boron concentration (1230 µg/L) from intermediate groundwater location Martin Spring was above the 750 µg/L NMWQCC groundwater standard (for irrigation use). Samples collected at this location since 1995 show similar boron concentrations.

The filtered nickel concentration of 731 µg/L at 754 ft. in an intermediate groundwater port of R-25 was above the NMWQCC groundwater standard of 200 µg/L. This result is the highest measured at this port during the past 9 yr (for data from outside analytical laboratories). A close result from August 2005 was 723 µg/L. Three results from separate samples collected during 2007 and analyzed by an internal laboratory ranged from 542 µg/L to 966 µg/L.

The RDX concentrations were above the EPA tap water screening level of 6.1 µg/L in two intermediate wells [CDV-16-1(i) and CDV-16-2(i)r at 26.8 µg/L and 78.9 µg/L, respectively); at three well ports of R-25 (754.8, 891.8, and 1192 ft at 41.8, 7.74, and 21.1 µg/L, respectively]; and in three intermediate springs (Martin, SWSC, and Burning Ground Springs at 102 µg/L, 43.4 µg/L, and 28.9 µg/L, respectively). The result of 7.7 µg/L at 891 ft in R-25 is the third highest of the measurements made since the first sample in 2000; most earlier results over the past 8 yr have been below 3.4 µg/L. At the other seven locations, RDX has been measured at similar concentrations at each location over the duration of sampling: 11 yr in the springs and 3 to 8 yr in the wells.

4.3 Sampling Program Modifications

No modifications to the periodic monitoring sampling for the Water Canyon/Cañon de Valle Watershed are proposed at this time.

5.0 INVESTIGATION-DERIVED WASTE

Appendix F discusses the management of wastes produced during this PME.

6.0 SUMMARY

6.1 Monitoring Results

An evaluation of the field parameter monitoring results is presented in Appendix B. Results of full parameters in subsequent monitoring events will be provided in the annual update to the IFGMP.

6.2 Analytical Results

6.2.1 Surface Water (Base Flow)

Two results from surface-water samples collected during this PME from Water Canyon exceeded regulatory standards or screening levels (Table 4.2-2) for aluminum. Previously unreported data indicate that one result (aluminum) from surface-water samples collected from Water Canyon exceeded regulatory standards or screening levels (Table 4.2-2).

6.2.2 Groundwater

Overall, 23 results from groundwater samples collected during this PME from Water Canyon exceeded regulatory standards or screening levels (Table 4.2-2). Two results from groundwater samples collected

during the previous PME from Water Canyon exceeded regulatory standards or screening levels (Table 4.2-2).

6.3 Data Gaps

Table 3.4-1 summarizes the field parameter data gaps encountered during this PME. The table provides a detailed account of sampling event deviations.

7.0 REFERENCES

The following list includes all documents cited in this report. Parenthetical information following each reference provides the author(s), publication date, and ER ID. This information is also included in text citations. ER IDs are assigned by the Environmental Programs Directorate's Records Processing Facility (RPF) and are used to locate the document at the RPF and, where applicable, in the Program master reference set.

Copies of the master reference set are maintained at the NMED Hazardous Waste Bureau and the Directorate. The set was developed to ensure that the administrative authority has all material needed to review this document, and it is updated with every document submitted to the administrative authority. Documents previously submitted to the administrative authority are not included.

[a] amsl = Above mean sea level.

[b] n/a = Not applicable.

[c] See Table 3.4-1 for explanation.

Table 3.4-1
Observations and Deviations

Location	Deviation	Cause	Comment
FCO-1, Peter Spring, WCO-1, WCO-3, CdV-R-37-2, screen 1	No data are included in this report for these locations.	These locations were not sampled on 03/24/09 because they were dry.	Location will be checked again during next sampling round.
CdV-R-15-3, Screens 1, 2, and 3	No data are included in this report for these locations.	The well was not sampled on 03/31/09 because all three screens were dry.	Well will be sampled during next sampling round if sufficient water is present.
WCO-2	No data are included in this report for this location.	The location was not sampled on 04/07/09 because it was dry.	Location will be checked again during next sampling round.
R-26 PZ-1	No data are included in this report for this location.	The location was not sampled on 04/08/09 because it was dry.	Location will be checked again during next sampling round.
CdV-16-02657, CdV-16-02658	Limited data are included in this report for these locations.	These locations were sampled for an abbreviated analytical suite on 03/31/09 because the wells purged dry.	Location will be checked again during next sampling round.
CdV-16-02655	Limited data are included in this report for this location.	The location was sampled for an abbreviated analytical suite on 04/01/09 because the well purged dry.	Location will be checked again during next sampling round.
FLC-16-25280	Limited data are included in this report for this location.	The location was sampled for an abbreviated analytical suite on 04/02/09 because the well purged dry.	Location will be checked again during next sampling round.
R-25, Screen 5	Limited data are included in this report for this location.	The location was sampled for an abbreviated analytical suite on 04/07/09 because the well purged dry.	Location will be checked again during next sampling round.
MSC-16-06293	Limited data are included in this report for this location.	The location was sampled for an abbreviated analytical suite on 04/09/09 because the well purged dry.	Location will be checked again during next sampling round.
R-26 PZ-2	Limited data are included in this report for this location.	The location was sampled for an abbreviated analytical suite on 04/15/09 because the well purged dry.	Location will be checked again during next sampling round.
R-25b	No data are included in this report for this location.	The location was not sampled on 04/07/09 because the well is still under development.	Location will be checked again during next sampling round.
WA-625 Spring	No data are included in this report for this spring.	The location was not sampled on 04/07/09 because the spring was covered by base flow.	Location will be checked again during next sampling round.

Table 4.2-1
Screening Levels for Groundwater and Surface Water at Los Alamos National Laboratory

Standard Type	Groundwater	Surface Water
DOE BCG	n/a[a]	X[b]
DOE 100 mrem Public Dose DCGs	X	n/a
DOE 4 mrem Drinking Water DCGs	X	n/a
EPA MCL	X	n/a
EPA Region 6 Tap Water Screening Level	X	n/a
New Mexico Environmental Improvement Board Radiation Protection Standards	X	X
NMWQCC Fisheries Standards Chronic	n/a	X
NMWQCC Fisheries Standards Chronic, Hardness = 100 mg/L	n/a	X
NMWQCC Groundwater Standard	X	n/a
NMWQCC Livestock Watering Standard	n/a	X
NMWQCC Wildlife Habitat Standard	n/a	X
NMWQCC Human Health Standard Ephemeral	n/a	X
NMWQCC Human Health Standard Perennial	n/a	X

[a] n/a = Not applicable.

[b] X = Standard applied to data screen for this report.

Table 4.2-2
Results above Screening Levels for Surface Water and Groundwater

Location	Date	Analyte	Field Preparation	Result	Units	Screening-Level Value	Screening-Level Origin
Surface Water, Previously Unreported Data							
Between E252 and Water at Beta	10/24/08	Aluminum	F[a]	203	µg/L	87	NM Aquatic Chronic
Surface Water, Current Data							
Water above SR-501	03/25/09	Aluminum	F	916	µg/L	750	NM Aquatic Acute
Between E252 and Water at Beta	04/10/09	Aluminum	F	772	µg/L	87	NM Aquatic Chronic
Alluvial Groundwater, Previously Unreported Data							
CDV-16-02659	10/08/08	Barium	F	6470	µg/L	1000	NMWQCC

[a] F = Filtered.

[b] UF = Unfiltered.

Appendix A

Conceptual Model

Canyon	Contaminant Sources	Alluvial Groundwater Contaminants	Intermediate Groundwater Contaminants	Regional Groundwater Contaminants
Cañon de Valle	Multiple dry and past effluent sources	Barium above New Mexico Water Quality Control Commission (NMWQCC) groundwater standard; RDX (hexahydro-1,3,5-trinitro-1,3,5-triazine) above U.S. Environmental Protection Agency (EPA) excess cancer risk level	Boron above NMWQCC groundwater standard; lead above tap water screening level; RDX above EPA excess cancer risk level; tetrachloroethene at 33% and trichloroethene at 34% of EPA maximum contaminant level	None
Water Canyon	Multiple dry and past effluent sources	None or little alluvial groundwater	No intermediate groundwater	None
Potrillo, Fence, and Indio Canyons	Minor dry sources	No alluvial groundwater	No intermediate groundwater	None

Water Canyon Gallery	—	—	10/18/07	WG	Temperature	12.8	deg C	FU071000GGCW01
Water Canyon Gallery	—	—	05/14/07	WG	Temperature	11.8	deg C	FU070500GGCW01

— = Not applicable.
µS/cm = Microsiemens per centimeter.
mV = Millivolt.
NTU = Nephelometric turbidity unit.
SU = Standard unit.
WG = Groundwater.
WS = Surface water.
WP = Persistent water.

Appendix C

Groundwater-Level Measurements

Appendix D

Analytical Results

The following symbols, abbreviations, and acronyms are used throughout Appendix D.

<	Based on qualifiers, the result was a nondetection.
—	none
*	(Inorganic) The result for this analyte in the Los Alamos National Laboratory (Laboratory) replicate analysis was outside acceptance criteria.
B	(Organic) This analyte was detected in the associated laboratory method blank and the sample. (B) (Inorganic) The result for this analyte was greater than the instrument detection limit but less than the contract-required detection limit.
CS	client sample
CST	control sample triplicate
DUP	duplicate sample
E	(Organic) The result for this analyte exceeded the upper range of the instrument initial calibration curve. (E) (Inorganic) (inductively coupled plasma–atomic emission spectroscopy). The result for this analyte in the serial dilution analysis was outside acceptance criteria. (E) (Inorganic) (graphite furnace atomic absorption) The result for this analyte failed one or more Contract Laboratory Program acceptance criteria as explained in the case narrative.
EES6	The Laboratory's Earth and Environmental Sciences Division (Hydrology, Geochemistry, and Geology Group)
EPA	U.S. Environmental Protection Agency
F	filtered
FD	field duplicate
FTB	field trip blank
GELC	General Engineering Laboratories
GEO	Geochron Analytical Laboratory
H	(Organic/Inorganic) The required extraction or analysis holding time for this result was exceeded.
HUFFMAN	Huffman Analytical Laboratory
Inorg	inorganic
J	(Organic/General Inorganics) The result for this analyte was greater than the method detection limit (MDL) but less than the practical quantitation limit.
J-	Presumptive evidence of the presence of the material is at an estimated quantity with a suspected negative bias.

J+	The analyte is classified as detected, but the reported concentration value is expected to be more uncertain than usual with a potential positive bias.
LLEE	low-level electrolytic extraction
LT	(Rad) The result for this analyte is affected by spectral interference.
JN-	Presumptive evidence of the presence of the material is at an estimated quantity with a suspected negative bias.
JN+	Presumptive evidence of the presence of the material is at an estimated quantity with a suspected positive bias.
MDA	minimum detectable activity
MDL	method detection limit
Met	metals
mV	millivolt
n/a	not applicable
NQ	No validation qualifier flag is associated with this result, and the analyte is classified as detected.
PARA	Paragon Analytical Laboratory
R	rejected
Rad	radionuclides
STSL	Severn Trent St. Louis Analytical Laboratory
SV	semivolatile organics
TPU	total propagated uncertainty
U	not detected
UF	unfiltered
UMTL	University of Miami Tritium Laboratory
VOA	volatile organic analysis
WG	groundwater
WM	snowmelt
WP	persistent water
WS	surface water

Appendix E

Screening Results

The following pages provide (1) acronyms and abbreviations and (2) analytical laboratory qualifier codes. The secondary data validation summary is provided in Appendix G.

Acronyms and Abbreviations

Code	Description
Field Prep Codes	
ASHED	Ashed
CRUSH	Crushed
F	Filtered
NA	Not Analyzed
SV	Sieved
UA	Unassigned
UF	Unfiltered
UNK	Unknown
Field QC Type Codes	
CO	Collocated
EQB	Equipment Blank
FB	Field Blank
FD	Field Duplicate
FPR	Field Prepared Reagent
FPS	Field Prepared Spike
FR	Field Rinsate
FS	Field Split
FTB	Field Trip Blank
FTR	Field Triplicate
INB	Equipment blank taken during installation and not associated with a sampling event
ITB	Trip blank taken during installation and not associated with a sampling event
n/a	Not Applicable
PE	Performance Evaluation
PEB	Performance Evaluation Blank
PEK	Performance Evaluation Known
RES	Resample
SS	Special Sampling Event, Data Unique
UA	Unassigned
Suite Codes	
DIOX/FUR	Dioxins and Furans
DRO	Diesel Range Organics
GENINORG	General Inorganics
HERB	Herbicides

Acronyms and Abbreviations (continued)

Code	Description
HEXP	High Explosives
METALS	Metal
PEST/PCB	Pesticides and PCBs
RAD	Radionuclides
SVOA	Semivolatile Organics
VOA	Volatile Organics
Lab Sample Type Codes	
BLIND	Blind Quality Control
BS	Blank Spike
BSD	Blank Spike Duplicate
CS	Client Sample
DL	Dilution
DUP	Duplicate
LCS	Laboratory Control Sample
LCSD	Laboratory Control Sample Duplicate
LCST	Laboratory Control Sample Triplicate
MB	Method Blank
MBD	Method Blank Duplicate
MBT	Method Blank Triplicate
MS	Matrix Spike
MSD	Matrix Spike Duplicate
MSQD	Matrix Spike Quadruplicate
MSQT	Fifth Matrix Spike
MST	Matrix Spike Triplicate
QNT	Fifth Replicate
QUD	Quadruplicate
RE	Reanalysis
REDP	Reanalysis Duplicate
RETRP	Reanalysis Triplicate
RI	Reissue
RID	Reissue Duplicate
SXT	Sixth Replicate
TOTC	Calculated Total
TOTCD	Calculated Total for a Duplicate
TRP	Triplicate

Analytical Laboratory Qualifier Codes

Laboratory Qualifier Code	Laboratory Qualifier Description
*	(Inorganic)—Duplicate analysis (relative percent difference) not within control limits. (Organic)—Spike recovery (relative percent difference) is equal to or outside the control criteria used.
B	(Organic)—Analyte present in the blank and the sample. (Inorganic)—reported value was obtained from a reading that was less than the contract-required detection limit (CRDL) but greater than or equal to the instrument detection limit (IDL).
BJ	See B code and see J code.
BJP	(B) (Organic)—This analyte was detected in the associated laboratory method blank and the sample. (B) (Inorganic)—The result for this analyte was greater than the IDL but less than the CRDL. (J) (Organic/General Inorganics)—The result for this analyte was greater than the method detection limit (MDL) but less than the practical quantitation limit (PQL). (P) (Pesticides/PCBs)—The quantitative results for this analyte between the primary and secondary gas chromatography (GC) columns were greater than 25% difference. (P) (SW-846 U.S. Environmental Protection Agency (EPA) Method 8310, High Pressure Liquid Chromatography, HPLC results)—The quantitative results for this analyte between the primary and secondary HPLC columns or primary and secondary HPLC detectors were greater than 40% difference.
BPX	(B) (Organic)—This analyte was detected in the associated laboratory method blank and the sample. (B) (Inorganic)—The result for this analyte was greater than the IDL but less than the CRDL. (P) (Pesticides/PCBs)—The quantitative results for this analyte between the primary and secondary GC columns were greater than 25% difference. (P) (SW-846 EPA Method 8310, High Pressure Liquid Chromatography, HPLC results)—The quantitative results for this analyte between the primary and secondary HPLC columns or primary and secondary HPLC detectors were greater than 40% difference. (X) (Organic/Inorganic)—The result for this analyte should be regarded as not detected.
DJ	(D) (Organic)—The result for this analyte was reported from a dilution. (J) (Organic/General Inorganics)—The result for this analyte was greater than the MDL but less than the PQL.
DNA	Did not analyze because equipment was broken.
E	EPA Flag—The result for this analyte exceeded the upper range of the instrument initial calibration curve.
EJ	(E) (Organic)—The result for this analyte exceeded the upper range of the instrument initial calibration curve. (E) (Inorganic) (inductively coupled plasma atomic emission spectroscopy [ICP-AES])—The result for this analyte in the serial dilution analysis was outside acceptance criteria.
EJN	(E) (Organic)—The result for this analyte exceeded the upper range of the instrument initial calibration curve. (E) (Inorganic) (ICP-AES)—The result for this analyte in the serial dilution analysis was outside acceptance criteria. (E) (Inorganic) (graphite furnace atomic absorption [GFAA])—The result for this analyte failed one or more Control Laboratory Program (CLP) acceptance criteria as explained in the case narrative. (J) (Organic/General Inorganics)—The result for this analyte was greater than the MDL but less than the PQL. (N) (Organic)—The reported analyte is a tentatively identified compound (TIC). (N) (Inorganic)—The result for this analyte in the matrix spike sample was outside acceptance criteria.
EN	See E code and see N code.

Analytical Laboratory Qualifier Codes (continued)

Laboratory Qualifier Code	Laboratory Qualifier Description
EN*	(E) (Organic)—The result for this analyte exceeded the upper range of the instrument initial calibration curve. (E) (Inorganic) (ICP-AES)—The result for this analyte in the serial dilution analysis was outside acceptance criteria. (E) (Inorganic) (GFAA)—The result for this analyte failed one or more CLP acceptance criteria as explained in the case narrative. (N) (Organic)—The reported analyte is a TIC. (N) (Inorganic)—The result for this analyte in the matrix spike sample was outside acceptance criteria. * (Inorganic)—The result for this analyte in the laboratory replicate analysis was outside acceptance criteria.
H	(H) (Organic/Inorganic)—The required extraction or analysis holding time for this result was exceeded.
H*	(H) (Organic/Inorganic)—The required extraction or analysis holding time for this result was exceeded. * (Organic) and (Inorganic)—The result for this analyte in the laboratory control sample analysis was outside acceptance criteria.
HJ	(H) (Organic/Inorganic)—The required extraction or analysis holding time for this result was exceeded. (J) (Organic/General Inorganics)—The result for this analyte was greater than the MDL but less than the PQL.
HJ*	(H) (Organic/Inorganic)—The required extraction or analysis holding time for this result was exceeded. (J) (Organic/General Inorganics)—The result for this analyte was greater than the MDL but less than the PQL. * (Inorganic)—The result for this analyte in the laboratory replicate analysis was outside acceptance criteria.
INS	(d15N)—The d15N of nitrate is a signature of the nitrate present in a sample. Therefore, nitrate has to be present to have a signature. A d15N value cannot be given to a blank, since the blank does not have nitrate. This is different than most analytical methods where you would run a blank and use the designator: “nondetect” or detected, but below detection limit.
J	(Inorganic)—The associated numerical value is an estimated quantity. (Organic)—The associated numerical value is an estimated quantity.
J*	This code is no longer used.
JB	See J code and see B code
JN	(J) (Organic/General Inorganics)—The result for this analyte was greater than the MDL but less than the Practical Quantitation Limit (PQL). (N) (Organic)—The reported analyte is a TIC.
JN*	(J) (Organic/Inorganic/General Inorganics)—The result for this analyte was greater than the MDL but less than the PQL. (N) (Organic)—The reported analyte is a TIC.
JP	See J code and see P code.
N	(Organic)—Presumptive evidence of presence of material. (Inorganic)—Spiked sample recovery not within control limits.
N*	This code is no longer used.
P	This code is no longer used.
U	(Inorganic)—The material was analyzed for but was not detected above the level of the associated numeric value. The associated numerical value is either the sample quantitation limit or the sample detection limit.

Analytical Laboratory Qualifier Codes (continued)

Laboratory Qualifier Code	Laboratory Qualifier Description
U*	See U code and see * code.
UE	See U code and see E code.
UEN	(U) (Organic/Inorganic)—The result for this analyte was not detected at the specified reporting limit. (E) (Organic)—The result for this analyte exceeded the upper range of the instrument initial calibration curve. Spiked sample recovery not within control limits.
UH	(U) (Organic/Inorganic)—The result for this analyte was not detected at the specified reporting limit. (H) (Organic/Inorganic)—The required extraction or analysis holding time for this result was exceeded.
UH*	(U) (Organic/Inorganic)—The result for this analyte was not detected at the specified reporting limit. (H) (Organic/Inorganic)—The required extraction or analysis holding time for this result was exceeded. * (Inorganic)—The result for this analyte in the Laboratory Replicate analysis was outside acceptance criteria.
UI	This code is no longer used.
UN	EPA flag (Inorganic)—Compound was analyzed for but was not detected. Spiked sample recovery not within control limits.
UN*	EPA flag (Inorganic)—Compound was analyzed for but was not detected. Spiked sample recovery not within control limits. Duplicate analysis not within control limits.
X	The result for this analyte was not detected at the specified reporting limit (used for gas chromatography methods).

Appendix F

Investigation-Derived Waste Management

F-1.0 INTRODUCTION

This appendix describes the storage and disposal of investigation-derived waste (IDW) generated during this periodic groundwater monitoring event conducted in the Water Canyon/Cañon de Valle Watershed under the Los Alamos National Laboratory (LANL or the Laboratory) Interim Facility-Wide Groundwater Monitoring Plan (IFGMP) (LANL 2008, 101897). IDW is waste generated as a result of field-investigation activities and may include, but is not limited to, purge water; contact waste consisting of contaminated personal protective equipment (PPE), sampling supplies, plastic, and paper; fluids from the decontamination of PPE and sampling equipment; and all other wastes potentially contacting contaminants. IDW generated during implementation of the IFGMP is managed to protect human health and the environment, comply with applicable regulatory requirements, and adhere to Laboratory waste minimization goals. The wastes are managed in accordance with the Water Canyon/Cañon de Valle Watershed groundwater monitoring waste characterization strategy form (WCSF), submitted in the September 2007 periodic monitoring report (PMR) (LANL 2007, 099017). The WCSF provides information on IDW characterization, management, containerization, analytical methods, and estimated waste volumes. The most recent version of the "Los Alamos National Laboratory Hazardous Waste Minimization Report" (LANL 2008, 104174) is being implemented during groundwater monitoring to minimize waste generation. The plan is updated annually as a requirement of Module VIII of the Laboratory's Hazardous Waste Facility Permit.

F-2.0 WASTE DETERMINATION

IDW characterization is completed through review of existing data and/or documentation and sampling of the media being investigated (i.e., groundwater). The groundwater analyses are augmented, as needed, by direct sampling of containerized waste to fulfill a treatment or disposal of facility's waste acceptance criteria (WAC). Under the 2008 IFGMP, the wastes from each sampling event were initially managed as hazardous wastes until the analytical data for that event were available. However, multiple analyses showed that the groundwater, and therefore the wastes, for a number of the wells were not hazardous. The 2008 IFGMP recognized this and allowed the number of sampling events used to make Resource Conservation and Recovery Act (RCRA) waste determinations to be based on acceptable knowledge (AK) of groundwater conditions within a watershed in the area of a well. AK includes reviews of existing analytical data and may also include source term/process identification performed to identify whether listed hazardous waste may be present (i.e., due diligence reviews). If low levels of listed hazardous waste are identified, a "contained-in" determination may be submitted for approval to NMED.

F-3.0 WASTE MANAGEMENT

All IDW generated during this periodic monitoring event is being managed in accordance with applicable standard operating procedures (SOPs). These SOPs incorporate the requirements of all applicable U.S. Environmental Protection Agency (EPA) and NMED regulations, U.S. Department of Energy orders, and Laboratory procedures.

The SOP applicable to the characterization and management of IDW is:

- EP-ERSS-SOP-5022, Characterization and Management of Environmental Restoration (ER) Project Waste (http://www.lanl.gov/environment/all/qa/adep.shtml).

The IDW streams associated with groundwater monitoring are identified in Table F-3.0-1 and are briefly described below. Table F-3.0-1 summarizes the waste types, volumes, characterization methods,

methods of on-site management, and disposition path for each waste stream. Only wastes generated during this particular monitoring event are discussed in this section and in Table F-3.0-1. The number of samples used to make the waste determination varies by sample location, depending on the classifications described above under section F-2.0, Waste Determination. If the waste has not yet been land-applied or shipped to the destination where it will be treated and/or disposed of, "Pending" appears in the "Disposition Status" column of Table F-3.0-1. Waste that has not yet been characterized is managed conservatively or based on previous analytical data. Existing waste disposal documentation (waste profile forms [WPFs], manifests, etc.) that are in use and have been submitted in a previous report (see bulleted list below) are not attached.

If a waste stream from a previous monitoring event was reported as pending land application or disposal and has since been land-applied or disposed of, the waste types, volumes, and characterization methods are updated in a table included in this appendix. However, no waste streams from previous monitoring events have been disposed of during this reporting period. If new disposal documents have been used since a previous reporting period, any new waste disposal documents are included in this appendix.

Purge water: The purge water waste stream consists of groundwater purged from wells in the Water/Cañon de Valle Watershed before sampling to ensure representative samples are collected. Purge water is being managed and characterized in accordance with the WCSF and ENV-RCRA-SOP-010.1, Land Application of Groundwater. ENV-RCRA-SOP-010.1 implements the NMED-approved Notice of Intent (NOI) Decision Tree for land application of drilling, development, rehabilitation, and sampling purge water.

During the monitoring activity, purge water was collected and containerized as it was removed from the wells. If purge water at a specific well has met the requirements for land application, it may have been directly land-applied, or it may have been containerized before land application. The type of container used depends on the volume of purge water expected and includes 5-gal. carboys, 55-gal. drums, and other containers. For transport U.S. Department of Transportation- (DOT-) approved containers are used, as appropriate. The containers of purge water are managed in accordance with their classification as nonhazardous/nonradioactive, hazardous, mixed, or radioactive waste, as follows.

- If purge water is hazardous or mixed waste, it is placed in registered hazardous waste accumulation areas that may be at the location of the wells or may be at other locations at the Laboratory. Unless NMED grants a contained-in or investigation of the sources of the contamination determines that the waste is not listed hazardous waste, the hazardous waste is treated or disposed of at a permitted off-site treatment, storage, and disposal (TSD) facility.
- Purge water that has been determined to be nonhazardous, including those for which NMED has granted a contained-in determination, is evaluated using ENV-RCRA-SOP-010.1 for land disposal. If land-application criteria are met, the purge water is land-applied as specified in the NOI decision tree. If land-application criteria cannot be met, the purge water is transported and/or disposed of at on-site facilities, if possible, or treated and/or disposed of at an authorized off-site facility if the WACs of on-site facilities cannot be met.

Contact waste: The contact waste stream consists of solid wastes generated during sampling that "contacted" potentially contaminated environmental media (i.e., purge water) and cannot be decontaminated. It consists primarily of contaminated PPE (primarily gloves); disposable sampling supplies; and dry decontamination wastes, such as paper items. Contact waste is stored in containers (e.g., 55-gal. drums) at monitoring sites or at waste accumulation areas appropriate for the regulatory status of the waste. DOT-approved containers are used, as appropriate, for transport. Characterization of this waste stream is being performed through AK from analytical results for the environmental media that

it came into contact with or through direct sampling of the containerized waste. The contact waste is managed in accordance with their classification as nonhazardous/nonradioactive, hazardous, mixed, or radioactive waste, as follows:

- Contact waste that has been in contact with nonhazardous, nonradioactive groundwater is disposed of at a New Mexico solid waste landfill using WPF 39268, a copy of which was included in Appendix F of a previous PMR (LANL 2008, 103737).
- If the contact wastes are hazardous or mixed wastes, they are placed in registered hazardous waste accumulation areas that may be at the location of the wells or may be at other locations at the Laboratory. Unless a contained-in determination is granted by NMED or a due diligence investigation of the sources of the contamination determines that the waste is not listed hazardous waste, the waste will be managed appropriately for its regulatory classification. If it is determined to be hazardous or mixed waste, it will be treated and/or disposed of at a permitted off-site TSD facility.
- If the contact wastes are nonhazardous but contain elevated radioactivity, the contact wastes may be designated as low-level radioactive waste and disposed of at Technical Area 54 (TA-54) Area G. Radioactive contact waste must be placed in registered radioactive staging or storage areas that may be at the location of the wells or may be at other locations at the Laboratory. If the Laboratory's Green Is Clean program verifies the contact waste is nonradioactive, it is disposed of at a New Mexico solid waste landfill.

Decontamination fluids: Consistent with waste minimization practices, the Laboratory employs dry decontamination methods to the extent possible. However, if dry decontamination cannot be performed, liquid decontamination is used. The decontamination fluids waste stream consists of decontamination solutions and rinse waters, such as deionized water and Alconox. Liquid decontamination wastes are collected in containers at the point of generation. The decontamination fluids waste stream is characterized through AK of the environmental media or direct sampling of the containerized waste. These wastes receive the same designation as the associated purge water. The containers of decontamination fluids are managed in accordance with their classification as nonhazardous/nonradioactive, hazardous, mixed, or radioactive waste, as follows.

- Nonhazardous/nonradioactive decontamination fluids may be sent to the Sanitary Waste System or the Sanitary Effluent Reclamation Facility.
- The Radioactive Liquid Waste Treatment Facility or the TA-53 evaporation basins treat radioactive wastewaters. Radioactive wastewaters must be placed in registered radioactive accumulation areas that may be at the location of the wells or may be at other locations at the Laboratory. If the decontamination fluids do not meet the WAC for these facilities, they are sent off-site for treatment and/or disposal.
- If the wastes are hazardous or mixed waste, they are placed in registered hazardous waste accumulation areas that may be at the location of the wells or may be at other locations at the Laboratory. Unless NMED grants a contained-in determination or a due diligence investigation of the sources of the contamination determines the waste is not listed hazardous waste, the waste will be managed appropriately for its regulatory classification. If it is determined to be hazardous or mixed waste, it will be treated or disposed of at a permitted off-site TSD facility.

F-4.0 REFERENCES

The following list includes all documents cited in this appendix. Parenthetical information following each reference provides the author(s), publication date, and ER ID. This information is also included in text citations. ER IDs are assigned by the Environmental Programs Directorate's Records Processing Facility (RPF) and are used to locate the document at the RPF and, where applicable, in the master reference set.

Copies of the master reference set are maintained at the NMED Hazardous Waste Bureau and the Directorate. The set was developed to ensure that the administrative authority has all material needed to review this document, and it is updated with every document submitted to the administrative authority. Documents previously submitted to the administrative authority are not included.

Table F-3.0-1
Summary of IDW Generation and Management

Waste Stream	Waste Type	Volume	Characterization Method	On-Site Management	Disposition Status
Purge Water	Nonhazardous, Nonradioactive	493 gal.	Analytical results from groundwater monitoring samples and AK	Originally managed conservatively and collected in containers, stored at satellite accumulation areas, or at less-than-90-day accumulation areas. These wastes have been determined to be nonhazardous based on data review, due diligence, and/or approved contained in documentation. The containers and accumulation areas have been downgraded to nonhazardous.	Pending transport to the TA-16 High Explosives Wastewater Treatment Facility (HEWTF). WPFs 38777 and 39113[a,b]
Purge Water	Suspect hazardous, suspect radioactive	11 gal.	Same as above	Managed as described above	Pending data, due diligence, contained in or WPF, and chemical waste disposal request (CWDR) approval and transport[a]
Purge Water	Nonhazardous, nonradioactive	208 gal.	Same as above	Managed as described above	Pending data, land application review, or WPF approval[a]
Contact Waste	Nonhazardous, Nonradioactive	0.11 yd^3 (23 gal.)	AK of the waste materials	Managed as described above	Disposed of at New Mexico solid waste landfill; WPF 39268[b]
Contact Waste	Suspect hazardous, Suspect radioactive	0.08 yd^3 (17 gal.)	AK of the waste materials	Managed as described above	Pending data, due diligence, contained in, or WPF and CWDR approval and transport[a]
Decontam-ination Fluids	Suspect hazardous, Suspect radioactive	7 gal.	AK of the waste materials	Managed as described above	Pending data, due diligence, contained in, or WPF and CWDR approval and transport[a]
Decontam-ination Fluids	Nonhazardous, Nonradioactive	10 gal.	AK of the waste materials	Managed as described above	Pending transport to the TA-16 HEWTF. WPFs 38777 and 39113[a,b]

[a] Disposal documentation is pending completion of transport.

[b] The existing WPF was submitted in Appendix F of the September 2008 White Rock Watershed PMR (LANL 2008, 103737).
