Title: Overview of RHIC-SPIN Program

Author(s): Ming X. Liu

Intended for: present an invited talk at the International Conference on Physics Education and Frontier Physics (OCPA6)
Overview of RHIC-SPIN Program

Ming Xiong Liu
Los Alamos National Lab

Since 2001, the RHIC at BNL has been running a program of colliding polarized proton-proton at centre of mass energy up to 500GeV, with beam polarization up to about 60%. It is the world first high-energy polarized proton-proton collider. The goals of RHIC-SPIN physics program are to determine the gluon's contribution to the proton spin, and the flavor identified quark and anti-quark distributions inside the polarized proton; and study spin asymmetries in transversely polarized proton-proton collisions. The latest results and future prospects from RHIC experiments will be discussed.
