Title:
New Observations by the MiniBooNE Experiment

Abstract:
The MiniBooNE neutrino oscillation search experiment at Fermilab has recently completed the analysis of anti-neutrino data it has collected in Fermilab's booster neutrino beam. With $5.66 \times 10^{20}$ protons on target in anti-neutrino mode the experiment is now becoming sensitive to the excess number-antineutrino signal observed by LSND. This presentation will discuss the MiniBooNE data, its interpretation, and its implications to the neutrino community.
