Delta Prime Site Aggregate Area Phase II Work Plan

Prepared by the Environmental Programs Directorate

Los Alamos National Laboratory, operated by Los Alamos National Security, LLC, for the U.S. Department of Energy under Contract No. DE-AC52-06NA25396, has prepared this document pursuant to the Compliance Order on Consent, signed March 1, 2005. The Compliance Order on Consent contains requirements for the investigation and cleanup, including corrective action, of contamination at Los Alamos National Laboratory. The U.S. government has rights to use, reproduce, and distribute this document. The public may copy and use this document without charge, provided that this notice and any statement of authorship are reproduced on all copies.

1.0 INTRODUCTION

Los Alamos National Laboratory (LANL or the Laboratory) Technical Area 21 (TA-21) Closure Project is investigating Delta Prime Site Area Aggregate sites potentially contaminated by past Laboratory operations. The sites addressed in this plan are located on Delta Prime Mesa within TA-21 (Figure 1 and Table 1). The sites under investigation are designated as solid waste management units (SWMUs) or areas of concern (AOCs). Individual SWMUs and AOCs may be grouped into consolidated units as a result of spatial proximity or function and are as follows:

Investigation Sites and Facility-Unimpacted Sites

- AOC 21-002(b)
- Consolidated Unit 21-003-99 and SWMU 21-024(c)
- SWMU 21-009
- SWMU 21-012(b)
- SWMU 21-013(c)
- SWMU 21-024(a)
- SWMU 21-024(e)
- SWMU 21-024(g)
- Consolidated Unit 21-024(l)-99
- SWMU 21-024(o)
- Consolidated Unit 21-026(a)-99
- SWMU 21-027(c)

Facility-Impacted Sites

- Consolidated Unit 21-006(c)-99
- SWMU 21-022(f)
- Consolidated Unit 21-022(h)-99
- Consolidated Unit 21-023(a)-99
- SWMU 21-024(b)
- SWMU 21-024(d)
- SWMU 21-024(h)
- SWMU 21-024(i)
- SWMU 21-024(j)
- SWMU 21-024(k)
- SWMU 21-024(n)
- SWMU 21-027(a)

This work plan presents the results of in-depth analysis of sample results from facility-unimpacted and facility-impacted corrective action sites within the Delta Prime Site Area Aggregate and proposes additional sampling to define extent of contamination. Proposed corrective actions activities for two polychlorinated biphenyl- (PCB-) contaminated sites are also presented.

2.0 NATURE AND EXTENT DETERMINATION

In the Delta Prime Site Aggregate Area Investigation Report, Revision 1 (LANL 2008, 102760) data were evaluated to determine if the vertical and lateral extent of contamination had been defined. Appendix B of the investigation report describes in detail the chemicals of potential concern (COPCs) for which extent of contamination is not defined.

For this Phase II Work Plan, EarthVision (a three-dimensional computer modeling program) was used to aid in further extent analysis and additional sampling location placement for COPCs at sites where extent is not defined. EarthVision converted numerical sample concentrations/activities into representative colors and allowed for three-dimensional representation of contamination (see Appendix A). This advanced presentation of the data aided in the determination of placement of additional samples to define extent of contamination. The new sampling locations proposed to further define lateral and vertical extent of contamination are presented as Figures 2 through 25 and Tables 2 through 25.

3.0 PROPOSED EXTENT SAMPLING

During development of this Phase II Work Plan, which involved a thorough review of the data using EarthVision, the Laboratory refined recommendations to the proposed extent sampling presented in the investigation report. In most cases, this review resulted in an increase to the number of samples to be collected at the sites. The differences between the proposed extent sampling in the investigation report versus the Phase II Work Plan are as follows.

Extent of Contamination at SWMU 21-013(c)

- Aluminum is within 2 times background concentrations. Therefore, no further sampling for aluminum is necessary.
- Vertical extent is not defined for plutonium-239 at sampling location 21-25653; therefore, plutonium-239 has been added to the extent sampling (proposed sampling location 1).

Extent of Contamination at SWMU 21-012(b)

- Lateral extent is not defined for strontium or zinc downslope of the center of the outfall area; therefore, these inorganic chemicals have been added to the extent sampling (proposed sampling location 4).
- Toluene increases with depth at one location at blowdown pit 21-267; however, nearby sampling locations provide vertical extent for toluene at deeper depths. Vertical and lateral extent are not defined for toluene at the southeast corner of the outfall; therefore, toluene has been added to the extent sampling (proposed sampling location 4).
- Lateral extent is defined downslope of the western side of the outfall for americium-241, cesium-137, and isotopic plutonium by samples collected from adjoining SWMU 21-024(a) at sampling location 21-27327.

Extent of Contamination at SWMU 21-024(e)

- Vertical extent is not defined for cesium-137 at one outfall location because the surface sample result was rejected by the analytical laboratory; therefore, additional sampling for cesium-137 is warranted (proposed sampling location 3). Vertical extent is defined for the remaining radionuclide COPCs by decreasing activities with depth. Lateral extent is defined for all radionuclide COPCs by decreasing activities downslope of the outfall pipe mouth.

Extent of Contamination at SWMU 21-024(g)

- Vertical extent is defined for arsenic under the septic tank; concentrations decrease with depth at adjacent sampling location 21-27627.
- Lateral extent is not defined for americium-241 downslope of the septic tank outfall; therefore, americium-241 has been added to extent sampling (proposed sampling location 1).

Extent of Contamination at Consolidated Unit 21-024(l)-99

- Lateral extent is not defined for SVOCs east of the eastern outfall pipe mouth; therefore, SVOCs have been included in the extent sampling (proposed sampling location 15).

Extent of Contamination at SWMU 21-024(o)

- Lateral extent is not defined for zinc on the west side of the outfall; therefore, zinc has been added to extent sampling (proposed sampling location 2).
- Vertical extent is not defined for cesium-137 at one location at the outfall because the second depth sampled was rejected by the analytical laboratory; however, surface activity is below the fallout value. Therefore, no additional sampling for cesium-137 is necessary at this location. Vertical extent is defined for the remaining radionuclide COPCs by decreasing activities with depth.
- Lateral extent is not defined for americium-241 east of the outfall area; therefore, americium-241 has been added to extent sampling (proposed sampling location 1).
- Lateral extent is not defined for plutonium-239 west of the outfall area; therefore, plutonium-239 has been added to extent sampling (proposed sampling location 2).

Extent of Contamination at Consolidated Unit 21-026(a)-99

- Lateral extent is defined for copper at the outfall by decreasing concentrations laterally.
- Vertical extent is not defined for isotopic plutonium; therefore, isotopic plutonium has been added to the extent sampling (proposed sampling location 1).
- Lateral extent is defined for americium-241 and isotopic plutonium downslope of the septic tank outfall by decreasing activities laterally.

Extent of Contamination at SWMU 21-027(c)

- Vertical extent is defined for mercury at the outfall mouth by adjacent sampling location 21-27399 (within 5 ft).
- Vertical extent is defined for strontium-90 by decreasing activities with depth.

- Lateral extent is not defined for isotopic plutonium; therefore, isotopic plutonium has been added to the extent sampling (proposed sampling location 1).

Extent of Contamination at Consolidated Unit 21-006(c)-99

- Americium-241, isotopic plutonium, and tritium activities increase with depth at the SWMU 21-006(b) seepage pit inlet pipe; however, activities decrease nearby (within 10 ft and downslope) under the seepage pit. Therefore, no further vertical extent sampling is necessary in this area.

Extent of Contamination at Consolidated Unit 21-023(a)-99

- Vertical extent is not defined for isotopic plutonium under septic tank 21-225; therefore, isotopic plutonium has been added to the extent sampling (proposed sampling location 2).

Extent of Contamination at SWMU 21-024(b)

- Nitrate concentrations on the east side of the outfall and under the removed pipe are low and likely naturally occurring; therefore, extent is defined in these areas. Lateral extent is not defined for nitrate because concentrations increase to the west of the outfall pipe mouth and concentrations are not likely naturally occurring; therefore, nitrate has been added to the extent sampling (proposed sampling location 1).
- Lateral extent is defined for isotopic plutonium by decreasing activities from the top to the bottom of the outfall.

Extent of Contamination at SWMU 21-024(d)

- Vertical extent is not defined for lead under the center of the septic tank; therefore, lead has been added to the extent sampling (proposed sampling location 1).
- Lateral extent is not defined for isotopic plutonium west of the outfall pipe mouth; therefore, isotopic plutonium has been added to the extent sampling (proposed sampling location 2).

Extent of Contamination at SWMU 21-024(n)

- Vertical extent is defined for barium at the western culvert outfall by decreasing concentrations with depth. Therefore, no further vertical extent sampling is necessary in this area.
- Vertical extent is not defined for lead under the storm grate pipe; therefore, lead has been added to the extent sampling (proposed sampling location 13).
- Vertical extent is defined for nitrate at the western culvert outfall by nearby sampling locations (within 5 ft). Therefore, no further vertical extent sampling is necessary in this area.
- Vertical extent is defined for cesium-137 at the site by decreasing activities with depth. Therefore, no further vertical extent sampling is necessary in this area.
- Vertical extent for americium-241 at the eastern culvert outfall is provided by nearby sampling locations (within 10 ft). Therefore, no further vertical extent sampling is necessary in this area.

3.1 Lateral Extent Sample Placement Strategy

There are two strategies for lateral extent sampling location placement: one for mesa-top locations and one for outfall locations. When lateral extent for a COPC is not defined on the mesa top, a sampling location is placed a distance (dependent upon the original sample spacing and the site boundary) from the original location in the direction in which lateral extent is not defined. When lateral extent for a COPC is not defined in an outfall, a sample is placed 10 ft or 20 ft from the original location in the direction in which lateral extent is not defined.

3.2 Vertical Extent Sample Placement Strategy

There are two strategies for vertical extent sampling location placement: one for mesa-top locations and one for outfall locations. When vertical extent for a COPC is not defined on the mesa top, a sample is collected at the original sampling location 5 ft deeper than the deepest depth previously sampled at the location of interest. When vertical extent for a COPC is not defined in an outfall that slopes down the side of the mesa to the bench, a sample is collected at the original sampling location 1 to 2 ft deeper than the deepest depth previously sampled at the location of interest.

This work plan will be executed following the processes and procedures described in the approved "Investigation Work Plan for Delta Prime Site Aggregate Area at Technical Area 21" (LANL 2004, 087461; NMED 2005, 089314).

4.0 CORRECTIVE ACTIONS AT THE PCB-CONTAMINATED SITES

As presented in the "Delta Prime Site Aggregate Area Investigation Report, Revision 1" (LANL 2008, 102760), additional investigation/remediation is required at Consolidated Unit 21-003-99 and SWMU 21-024(c), which are regulated under the Toxic Substances Control Act. At these two sites, PCB concentrations are above the cleanup level of 1 mg/kg. Table 26 presents the corrective action approach to these sites. Figures 26 and 27 present the pre- and postexcavation sampling locations and proposed excavation areas.

5.0 SCHEDULE

Upon New Mexico Environment Department (NMED) approval of the Phase II Work Plan, the Laboratory will schedule the field activities. The results from the Phase II extent samples will be reviewed as soon as they have gone through the verification and validation process to ensure all extent issues are resolved and there are sufficient data to perform a risk-screening assessment for each site. If the Phase II results indicate additional extent sampling is required, the Laboratory will work closely with NMED to choose additional sampling locations to resolve any extent issues.

Readiness review and mobilization will occur 45 d after approval of the work plan. Field activities, as presented in this plan, will require 2 mo to complete. Validated data will be received 2 mo after field activities are complete. The Laboratory assumes two additional weeks of field activities will be required after review of the validated data to finalize the nature and extent sampling. The Laboratory will submit the Phase II investigation report 6 mo after all the extent samples are collected.

The Phase II investigation report will present all of the Phase I and Phase II data in the figures and in table format. The Phase II investigation report will discuss only the results of the Phase II sampling effort.

The Phase II investigation report will include a risk-screening assessment for each site that includes all of the Phase I and Phase II data.

6.0 REFERENCES

The following list includes all documents cited in this plan. Parenthetical information following each reference provides the author(s), publication date, and ER identification (ID) number. This information is also included in text citations. ER ID numbers are assigned by the EP Directorate Records Processing Facility (RPF) and are used to locate the document at the RPF and, where applicable, in the master reference set.

Copies of the master reference set are maintained at the NMED Hazardous Waste Bureau; the DOE–Los Alamos Site Office; EPA, Region 6; and the EP Directorate. The set was developed to ensure that the administrative authority has all material needed to review this document, and it is updated with every document submitted to the administrative authority. Documents previously submitted to the administrative authority are not included.

Table 26
PCB Remediation at Consolidated Unit 21-003-99 and SWMU 21-024(c)

Actions	Work Description
1. Lateral and vertical extent samples will be collected for PCB analyses to define the areas to be excavated.	Figure 26 and Table 27 present the proposed PCB sampling locations to define the areas to be excavated. Samples will be collected following the processes and procedures described in the "Investigation Work Plan for Delta Prime Site Aggregate Area at Technical Area 21," approved by NMED (with modifications) on April 11, 2005. After review of pre-excavation sampling PCB results, additional sampling may be necessary to define the excavation areas. If necessary, step-out samples will be collected laterally at 10-ft intervals and vertically at 1-ft intervals.
2. Environmental media containing total PCBs at concentrations greater than the 1-mg/kg cleanup level will be excavated.	Figure 26 presents the areas to be excavated at Consolidated Unit 21-003-99 and SWMU 21-024(c) based on existing characterization data. • Areas 1 and 7 will be excavated to a depth of 1.5 ft; • Areas 2 and 4 will be excavated to a minimum depth of 2.0 ft (deeper samples at locations 9 and 18 will be collected to determine if the total excavation depth needs to be deeper in these areas); • Areas 3 and 5 will be excavated to a depth of 0.5 ft; • Area 6 will be excavated to a depth 10 ft (6 ft below base of former septic tank 21-056); and • Area 8 will be excavated to a minimum depth of 5.5 ft (deeper samples at locations 27 and 30 will be collected to determine if the total excavation depth needs to be deeper in this area). These excavation areas may change depending on the PCB results from the extent sampling (Table 27).
3. Confirmatory samples will be collected to verify that total PCBs concentrations greater than the 1-ppm cleanup level have been removed.	Quick-turn analysis will be utilized to guide excavations in the field. PCB data will be compared to the cleanup level of 1 mg/kg to determine if the cleanup goal was met. Confirmation samples will be collected on a 25-ft grid pattern 0 to 0.5 ft below the base of the excavation (Figure 27). Sidewall samples will be collected every 25 ft along each of the excavation area perimeter walls.
