SM-43, Nerve Center of a National Laboratory:

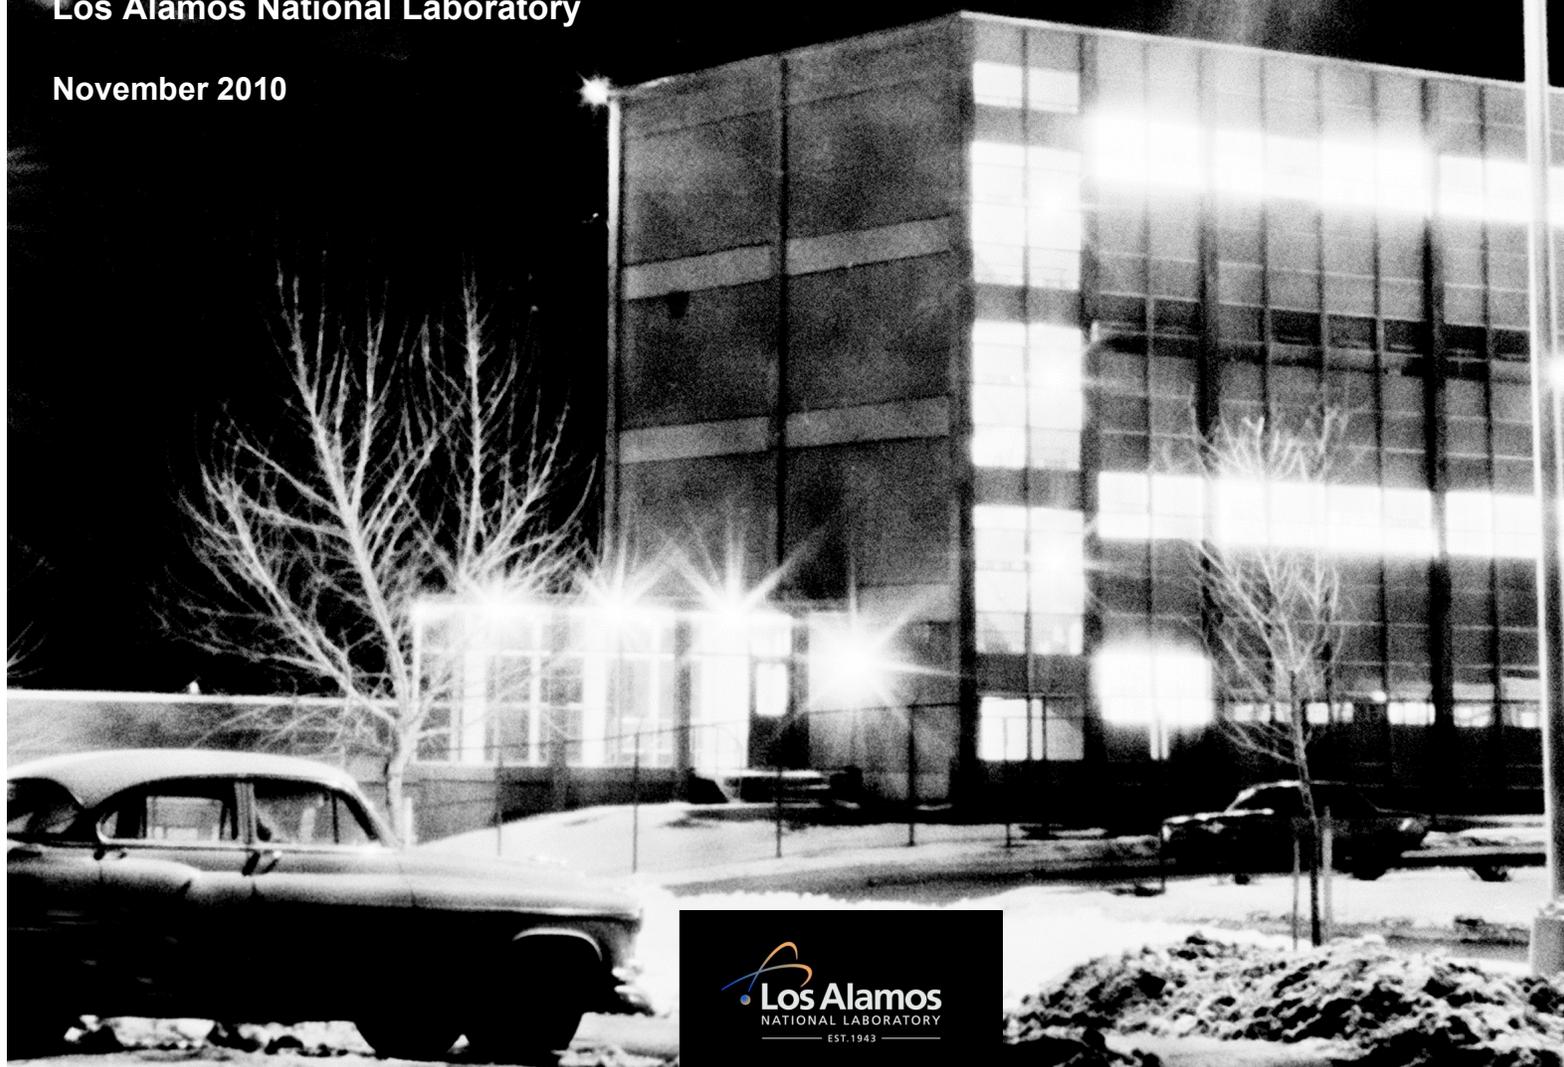

A History of the Los Alamos Administration Building (1956–2006)

Volume 2

Historic Building Survey Report No. 309

Los Alamos National Laboratory

November 2010

Editing and Composition by Hector Hinojosa, Group IRM-CAS

Cover photo: Administration Building at night, circa 1957 (LANL Photography).

Los Alamos National Laboratory, an affirmative action/equal opportunity employer, is operated by the Los Alamos National Security, LLC for the National Nuclear Security Administration of the U.S. Department of Energy under contract DE-AC52-06NA25396. By acceptance of this article, the publisher recognizes that the U.S. Government retains a nonexclusive, royalty-free license to publish or reproduce the published form of this contribution, or to allow others to do so, for U.S. Government purposes. Los Alamos National Laboratory requests that the publisher identify this article as work performed under the auspices of the U.S. Department of Energy. Los Alamos National Laboratory strongly supports academic freedom and a researcher's right to publish; as an institution, however, the Laboratory does not endorse the viewpoint of a publication or guarantee its technical correctness.

Los Alamos County
New Mexico

Notes: The Los Alamos National Laboratory (LANL) is divided into different geographic areas called technical areas (TAs) that are designated by numbers. The properties at TA-3 “South Mesa Site” are identified using the current LANL system of placing the “TA” prefix and TA number before each building and structure number, creating a unique property identifier (i.e., TA-3-43).

The Administration Building at LANL is located on South Mesa, across Los Alamos Canyon and south of the town of Los Alamos. First occupied in March of 1956, the building is situated within LANL’s TA-3. The “Admin” Building, also known as SM (South Mesa) 43, was the administrative center of the Laboratory for 50 years. As the heart of Laboratory activities during the Cold War years and beyond (from July 1956 to May 2006), the Admin Building not only housed the people and the bureaucracies needed to run a major national scientific laboratory but was itself the site of significant research and development projects for much of its lifetime.

This eligible building is excess LANL property and is scheduled for clean up and eventual demolition. The Decontamination and Decommissioning (D&D) action is in accordance with LANL’s commitment to clean up inactive sites and facilities “so that no unacceptable risk to the public or environment remains” (U.S. Department of Energy 1994). The removal of this property will be carried out by LANL’s D&D Program. (For additional information see related project documentation: “*LANL Administration Building, TA-3-43; An Eligibility Assessment Report*, LA-UR-01-2303, Cultural Resource Report No. 192 and this report final report “*SM-43, Nerve Center of a National Laboratory: A History of the Los Alamos Administration Building (1956–2006)*,” LA-UR-11-00922, Historic Building Report No. 309).

RB08-005-001 through RB08-005-008

The LANL Administration Building TA-3-43 (SM-43) is “H-shaped” with the main entrance on the north side of the crossbar of the “H.” The exterior building photos refer to the wings/arms of the “H” by their location (southwest, southeast, northwest, and northeast wings). The interior building photos location descriptions follow the existing floor plan wing designations (A, B, C, and D wings). “A” wing is the west/left leg of the “H,” “B” wing is the western/left half of the crossbar of the “H,” “C” wing is the eastern/right half of the crossbar of the “H,” and “D” wing is the east/right leg of the “H.”

ENERGY AND TECHNOLOGY

Environmental Control to Arms Control

Los Alamos National Laboratory dedicates a wide range of effort to developing safe, reliable technology to meet the energy needs of the future — an adequate supply of energy, stewardship of the environment, and arms control/defense. Our programs range from biological solutions for environmental cleanup to enhancing the recovery of domestic oil, from ensuring the safety of nuclear reactors to verifying compliance with arms control treaties. These programs complement our national security mission by supporting our defense work and by contributing technology that helps ensure U.S. energy security.

ENERGY

to Arms Control

Los Alamos National Laboratory dedicates a wide range of effort to developing safe, reliable technology to meet the energy needs of the future — an adequate supply of energy, stewardship of the environment, and arms control/defense. Our programs range from biological solutions for environmental cleanup to enhancing the recovery of domestic oil, from ensuring the safety of nuclear reactors to verifying compliance with arms control treaties. These programs complement our national security mission by supporting our defense work and by contributing technology that helps ensure U.S. energy security.

ENERGY AND TECHNOLOGY

Environmental Control to Arms Control

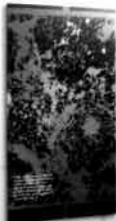

Los Alamos National Laboratory dedicates a widely varied effort to developing safe, reliable technologies to meet three major national concerns—an adequate supply of energy, stewardship of the environment, and arms control/safeguards. Our programs range from biological solutions for environmental cleanup to enhancing the recovery of domestic oil, from assuring the safety of nuclear reactors to verifying compliance with arms control treaties. These programs complement our national security mission by supporting our defense work and by contributing technology that helps ensure U.S. energy security.

ENERGY

Alternative Resources for America

The Department of Energy is committed to developing alternative energy resources to meet the nation's growing energy needs. This includes research and development in renewable energy, energy efficiency, and advanced nuclear reactors.

Los Alamos National Laboratory is a leading center for research and development in energy and technology. Our work is focused on developing safe, reliable technologies to meet the nation's growing energy needs. This includes research and development in renewable energy, energy efficiency, and advanced nuclear reactors.

BASIC RESEARCH

"The world's greatest achievements begin with an inquisitive mind"

World-class basic and applied research provides the technical base for reimagining a dynamic, fast-paced science and engineering landscape. Matching the best minds in science and engineering with technical problems has made us an innovative institution for students and continues to strengthen our scientific vitality. Encompassing the varied disciplines of life sciences, medicine, and high-energy physics, computing, nuclear physics, theory, nonlinear studies and neutron scattering, our programs reach across the Laboratory to help meet local, state, national, and international goals.

BASIC RESEARCH

"The world's greatest achievements begin with an inquisitive mind."

World-class basic and applied research provides the technical base for remaining a dynamic, first-rate science and engineering institution. Matching the best minds in science and engineering with technical problems has made us an innovative institution for decades and continues to strengthen our scientific vitality. Encompassing the varied disciplines of life sciences, medium- and high-energy physics, computing, nuclear physics, theory, nonlinear optics and neutron scattering, our programs reach across the Laboratory to help meet local, state, national, and international goals.

PHYSICS

World-class basic and applied research provides the technical base for remaining a dynamic, first-rate science and engineering institution. Matching the best minds in science and engineering with technical problems has made us an innovative institution for decades and continues to strengthen our scientific vitality. Encompassing the varied disciplines of life sciences, medium- and high-energy physics, computing, nuclear physics, theory, nonlinear optics and neutron scattering, our programs reach across the Laboratory to help meet local, state, national, and international goals.

COMPUTING

World-class basic and applied research provides the technical base for remaining a dynamic, first-rate science and engineering institution. Matching the best minds in science and engineering with technical problems has made us an innovative institution for decades and continues to strengthen our scientific vitality. Encompassing the varied disciplines of life sciences, medium- and high-energy physics, computing, nuclear physics, theory, nonlinear optics and neutron scattering, our programs reach across the Laboratory to help meet local, state, national, and international goals.

THEORY

World-class basic and applied research provides the technical base for remaining a dynamic, first-rate science and engineering institution. Matching the best minds in science and engineering with technical problems has made us an innovative institution for decades and continues to strengthen our scientific vitality. Encompassing the varied disciplines of life sciences, medium- and high-energy physics, computing, nuclear physics, theory, nonlinear optics and neutron scattering, our programs reach across the Laboratory to help meet local, state, national, and international goals.

NUCLEAR PHYSICS

World-class basic and applied research provides the technical base for remaining a dynamic, first-rate science and engineering institution. Matching the best minds in science and engineering with technical problems has made us an innovative institution for decades and continues to strengthen our scientific vitality. Encompassing the varied disciplines of life sciences, medium- and high-energy physics, computing, nuclear physics, theory, nonlinear optics and neutron scattering, our programs reach across the Laboratory to help meet local, state, national, and international goals.

NONLINEAR OPTICS

World-class basic and applied research provides the technical base for remaining a dynamic, first-rate science and engineering institution. Matching the best minds in science and engineering with technical problems has made us an innovative institution for decades and continues to strengthen our scientific vitality. Encompassing the varied disciplines of life sciences, medium- and high-energy physics, computing, nuclear physics, theory, nonlinear optics and neutron scattering, our programs reach across the Laboratory to help meet local, state, national, and international goals.

NEUTRON SCATTERING

World-class basic and applied research provides the technical base for remaining a dynamic, first-rate science and engineering institution. Matching the best minds in science and engineering with technical problems has made us an innovative institution for decades and continues to strengthen our scientific vitality. Encompassing the varied disciplines of life sciences, medium- and high-energy physics, computing, nuclear physics, theory, nonlinear optics and neutron scattering, our programs reach across the Laboratory to help meet local, state, national, and international goals.

LIFE SCIENCES

World-class basic and applied research provides the technical base for remaining a dynamic, first-rate science and engineering institution. Matching the best minds in science and engineering with technical problems has made us an innovative institution for decades and continues to strengthen our scientific vitality. Encompassing the varied disciplines of life sciences, medium- and high-energy physics, computing, nuclear physics, theory, nonlinear optics and neutron scattering, our programs reach across the Laboratory to help meet local, state, national, and international goals.

NUCLEAR WEAPONS TECHNOLOGY

The Nuclear Weapons Technology program at Los Alamos is a leading force in addressing some of the most complex challenges facing our nation and the world, including global change. A broad-based research and development activity, it supports a national defense policy founded on nuclear deterrence that has made a major contribution to over forty years of stability. Our research-to-retirement stewardship of nuclear weapons draws on capabilities in designing, developing, and testing nuclear devices, nuclear materials research and development, and stockpile management and retirement. Programs in nuclear directed-energy weapons and inertial confinement fusion place the Laboratory at the leading edge of advanced technology. These contributions to the solution of defense-related problems help to make the Laboratory a principal force in our nation's quest for national security and world peace.

DEFENSE RESEARCH AND APPLICATIONS

Undersea, on the Ground, and in Space

Nonnuclear defense draws on the technology base developed in support of the Nuclear Weapons Programs. In the field of conventional ordnance and materials technology, our programs are producing significant advances in armor and armor. In support of the Strategic Defense Initiative, we are investigating the use of x-ray beams and the free-electron laser for operation in space or in the earth's atmosphere. Programs in defense draw on the extensive interdisciplinary skills of the Laboratory, bringing together our leaders from many fields, including physics, chemistry, materials science, computational science, and engineering.

MICROHOLE DRILL HITS THE BULL'S EYE

A Penny-Wise, Environmentally-Smart Drilling Solution

The microhole drill bit is a revolutionary new technology that allows for the drilling of small-diameter holes in hard rock formations.

This technology is being used to drill holes for water supply, geothermal energy, and environmental monitoring.

The microhole drill bit is a revolutionary new technology that allows for the drilling of small-diameter holes in hard rock formations.

Dynamic materials studies and subcritical experiments

Recent Radiography
High resolution, high speed radiography provides a unique view of the dynamic behavior of materials under conditions of high pressure and temperature. This technology is used to study the behavior of materials under conditions that are similar to those that would be encountered in a nuclear weapon. The resulting data is used to improve the design and performance of nuclear weapons.

Subcritical Experiments
Subcritical experiments are used to study the behavior of materials under conditions that are similar to those that would be encountered in a nuclear weapon. These experiments are used to improve the design and performance of nuclear weapons.

FINANCING THE INCREASING COMPLEXITY OF LARGE-SCALE CLUSTER COMPUTERS

Cluster computing has become a critical technology for many scientific and engineering applications. The increasing complexity of these systems has led to a need for more sophisticated financing solutions. This report explores the challenges of financing large-scale cluster computers and offers strategies for overcoming them.

Los Alamos Neutron Science Center
Proton Radiography (pRad)

Proton radiography is a non-destructive technique used to inspect the internal structure of large, complex objects. It is based on the principle of proton scattering. The technique is used to inspect the internal structure of large, complex objects, such as aircraft engines, ship hulls, and industrial machinery. The technique is used to inspect the internal structure of large, complex objects, such as aircraft engines, ship hulls, and industrial machinery.

The proton radiography technique is used to inspect the internal structure of large, complex objects. It is based on the principle of proton scattering. The technique is used to inspect the internal structure of large, complex objects, such as aircraft engines, ship hulls, and industrial machinery. The technique is used to inspect the internal structure of large, complex objects, such as aircraft engines, ship hulls, and industrial machinery.

The proton radiography technique is used to inspect the internal structure of large, complex objects. It is based on the principle of proton scattering. The technique is used to inspect the internal structure of large, complex objects, such as aircraft engines, ship hulls, and industrial machinery. The technique is used to inspect the internal structure of large, complex objects, such as aircraft engines, ship hulls, and industrial machinery.

The proton radiography technique is used to inspect the internal structure of large, complex objects. It is based on the principle of proton scattering. The technique is used to inspect the internal structure of large, complex objects, such as aircraft engines, ship hulls, and industrial machinery. The technique is used to inspect the internal structure of large, complex objects, such as aircraft engines, ship hulls, and industrial machinery.

The proton radiography technique is used to inspect the internal structure of large, complex objects. It is based on the principle of proton scattering. The technique is used to inspect the internal structure of large, complex objects, such as aircraft engines, ship hulls, and industrial machinery. The technique is used to inspect the internal structure of large, complex objects, such as aircraft engines, ship hulls, and industrial machinery.

The proton radiography technique is used to inspect the internal structure of large, complex objects. It is based on the principle of proton scattering. The technique is used to inspect the internal structure of large, complex objects, such as aircraft engines, ship hulls, and industrial machinery. The technique is used to inspect the internal structure of large, complex objects, such as aircraft engines, ship hulls, and industrial machinery.

Calculating to Stakeholder Stewardship

Understanding process phenomena for maintaining near readiness

The diagram illustrates a process flow for stakeholder stewardship. It starts with a box labeled "Understanding process phenomena" and leads to "Calculating to Stakeholder Stewardship". The flowchart includes several intermediate steps and a final box labeled "Maintaining near readiness".

Assessing Phenomena That Affect Nuclear Weapons and Their

The panel discusses the assessment of phenomena that affect nuclear weapons and their components. It includes a diagram showing a cross-section of a nuclear weapon and a flowchart illustrating the assessment process.

Understanding the Physics of a

The panel discusses the physics of a specific phenomenon, likely related to nuclear weapons. It includes a diagram showing a cross-section of a nuclear weapon and a flowchart illustrating the physics process.

Research Using

The panel discusses research using a specific technique, likely related to nuclear weapons. It includes a diagram showing a cross-section of a nuclear weapon and a flowchart illustrating the research process.

Understanding the

The panel discusses the understanding of a specific phenomenon, likely related to nuclear weapons. It includes a diagram showing a cross-section of a nuclear weapon and a flowchart illustrating the understanding process.

Do Not Block Aisles or Exits

Discarded Personnel are not
allowed to linger in hallways
of this building due to the
possibility of mistaken identity
at various offices.

Official personnel should be escorted
down to the top of this building.

Uncleared Personnel are not allowed to linger in hallways of this building due to the processing of classified matter in various offices.

Uncleared personnel should be escorted directly in and out of this building.

EMERGENCY INFORMATION
TAC 3100, 41, 510 Floor
COMBINATION BUILDING

ESAH POLICY

The purpose of this policy is to ensure that all personnel are aware of the Emergency Support and Assistance (ESAH) policy and procedures. This policy is designed to provide a clear and concise overview of the policy and procedures for the 41st floor of the Combination Building. The policy is intended to be used as a reference for all personnel who work on the 41st floor of the Combination Building.
