Work Order Task Instructions

DO NOT lubricate the bearings if the FGR fan is NOT in operation or in service so that proper amount of grease can be applied using headphones
You can hear when grease reaches the bearing rolling element. At this point, stop adding grease to prevent bearing damage from overheating

There are two bearings on the fan, each with its own zerk plug
Remove the shaft guard located in the middle of the drive. The two zerk plugs are located on each of the two bearings

1. Use grease gun with the Ultralube headphones to insert the correct amount

of Mobilith SHC 100 grease into zerk fitting
b. Apply grease while fan is running and stop when you hear the grease enter the running bearing

Lubricated fan bearings on FGR-001,FGR-002 & FGR-003

4. Add grease with a hand-operated pressure gun until new grease enters the running bearing
a. This is accomplished by using the ultrasonic sensor and headphones to hear when the new grease enters the running bearing
b. Stop adding grease when the grease reaches the bearing to limit excess grease from migrating down the motor shaft and into the windings
Note: Be careful when greasing the fan end bearing of the TEFC (Totally (Totally Enclosed Fan Cooled) motors. Some motors have a spring-relief outlet grease fitting on the fan end that is not accessible. This spring-relief fitting normally does not have to be removed when regreasing. When greasing, take care in the amount of pressure you apply and verify relief is working
5. Putting in too much or too little grease can cause overheating of the motors and result in motor failure. Use this rule of thumb when adding grease to a motor that has been lubricated on a regular basis:
It is better to use a little grease more often than a lot of grease less often
Note: Watch out for motors that were shipped only with the bearings packed and not the fill tube or even the bearing housing
Apply new grease until you can hear it enter the running bearing
6. Now that greasing is complete, leave the relief plug off and run the motor for 10 minutes to expel any excess grease
7. Replace the drain plug and wipe the bearing housing clean
8. Dispose of dirty rags in accordance with Hazardous Waste Guidelines
9. Ensure correct operation of electric motors.

Lubricated fan bearings on FGR–001,FGR–002 & FGR–003

4. Add grease with a hand–operated pressure gun until new grease enters the running bearing
a. This is accomplished by using the ultrasonic sensor and headphones to hear when the new grease enters the running bearing
b. Stop adding grease when the grease reaches the bearing to limit excess grease from migrating down the motor shaft and into the windings
Note: Be careful when greasing the fan end bearing of the TEFC (Totally (Totally Enclosed Fan Cooled) motors. Some motors have a spring–relief outlet grease fitting on the fan end that is not accessible. This spring–relief fitting normally does not have to be removed when regreasing. When greasing, take care in the amount of pressure you apply and verify relief is working
5. Putting in too much or too little grease can cause overheating of the motors and result in motor failure. Use this rule of thumb when adding grease to a motor that has been lubricated on a regular basis:
It is better to use a little grease more often than a lot of grease less often
Note: Watch out for motors that were shipped only with the bearings packed and not the fill tube or even the bearing housing
Apply new grease until you can hear it enter the running bearing
6. Now that greasing is complete, leave the relief plug off and run the motor for 10 minutes to expel any excess grease
7. Replace the drain plug and wipe the bearing housing clean
8. Dispose of dirty rags in accordance with Hazardous Waste Guidelines
9. Ensure correct operation of electric motors.

Lubricated fan bearings on FGR-001,FGR-002 & FGR-003

4. Add grease with a hand-operated pressure gun until new grease enters the running bearing
a. This is accomplished by using the ultrasonic sensor and headphones to hear when the new grease enters the running bearing
b. Stop adding grease when the grease reaches the bearing to limit excess grease from migrating down the motor shaft and into the windings
Note: Be careful when greasing the fan end bearing of the TEFC (Totally (Totally Enclosed Fan Cooled) motors. Some motors have a spring-relief outlet grease fitting on the fan end that is not accessible. This spring-relief fitting normally does not have to be removed when regreasing. When greasing, take care in the amount of pressure you apply and verify relief is working
5. Putting in too much or too little grease can cause overheating of the motors and result in motor failure. Use this rule of thumb when adding grease to a motor that has been lubricated on a regular basis:
It is better to use a little grease more often than a lot of grease less often
Note: Watch out for motors that were shipped only with the bearings packed and not the fill tube or even the bearing housing
Apply new grease until you can hear it enter the running bearing
6. Now that greasing is complete, leave the relief plug off and run the motor for 10 minutes to expel any excess grease
7. Replace the drain plug and wipe the bearing housing clean
8. Dispose of dirty rags in accordance with Hazardous Waste Guidelines

Work Order Task Instructions

DO NOT lubricate the bearings if the FGR fan is NOT in operation or in service so that proper amount of grease can be applied
using headphones
You can hear when grease reaches the bearing rolling element. At this point, stop adding grease to prevent bearing damage from overheating

There are two bearings on the fan, each with its own zerk plug
Remove the shaft guard located in the middle of the drive. The two zerk plugs are located on each of the two bearings

1. Use grease gun with the Ultralube headphones to insert the correct amount

b. Apply grease while fan is running and stop when you hear the grease enter the running bearing

Lubricated fan bearings on FGR–001,FGR–002 & FGR–003

4. Add grease with a hand–operated pressure gun until new grease enters the running bearing
a. This is accomplished by using the ultrasonic sensor and headphones to hear when the new grease enters the running bearing
b. Stop adding grease when the grease reaches the bearing to limit excess grease from migrating down the motor shaft and into the windings
Note: Be careful when greasing the fan end bearing of the TEFC (Totally (Totally Enclosed Fan Cooled) motors. Some motors have a spring–relief outlet grease fitting on the fan end that is not accessible. This spring–relief fitting normally does not have to be removed when regreasing. When greasing, take care in the amount of pressure you apply and verify relief is working
5. Putting in too much or too little grease can cause overheating of the motors and result in motor failure. Use this rule of thumb when adding grease to a motor that has been lubricated on a regular basis:
It is better to use a little grease more often than a lot of grease less often
Note: Watch out for motors that were shipped only with the bearings packed and not the fill tube or even the bearing housing
Apply new grease until you can hear it enter the running bearing
6. Now that greasing is complete, leave the relief plug off and run the motor for 10 minutes to expel any excess grease
7. Replace the drain plug and wipe the bearing housing clean
8. Dispose of dirty rags in accordance with Hazardous Waste Guidelines
9. Ensure correct operation of electric motors.

Introduction

Exhaust emissions testing was conducted on a natural gas-fired centrifugal internal combustion engine (turbine) in service at Los Alamos National Laboratory's TA-3 Power Plant. The purpose of this test was to demonstrate compliance with the requirements specified in the New Mexico Environment Department NMED-AQB Title V Permit Number P100-R2M4 annual testing requirements.

Testing on Unit #TA-3-22 was performed at the maximum load available at the time of the test (95.9%). The testing followed the procedures set forth in the ASTM D6522-00. Oxides of nitrogen (NO_X defined as NO + NO_2) and carbon monoxide (CO) oxygen (O_2), and carbon dioxide (CO_2) were measured from the exhaust stack to derive the mass emission rates of the compounds of interest. NO_X and CO are the criteria pollutants of interest which are limited by the air permit. Compliance Services and Testing conducted all gaseous sampling on November 29, 2022.

Summary of Results

NO_X has a permitted emission limit of 23.8 pounds per hour (lbs/hr) and 59.4 tons per year (tpy). CO has a permit limit of 29.0 lbs/hr and 72.3 tpy. The tons per year mass emission rates are limited by annual fuel consumption of no more than 1400 MMSCF. The annual fuel consumption limit was divided by the average hourly fuel consumption during the test to calculate the maximum allowable annual hours of operation at full load (6310.1 hours per year). The average lb/hr emission values from the testing were then multiplied by these annual hours of operation number to calculate estimated ton per year emissions. NO_X also has a limit of 25 ppmvd (parts per million by volume on a dry basis) at 15% O2. The results show that NO_X and CO are below the permitted limits.

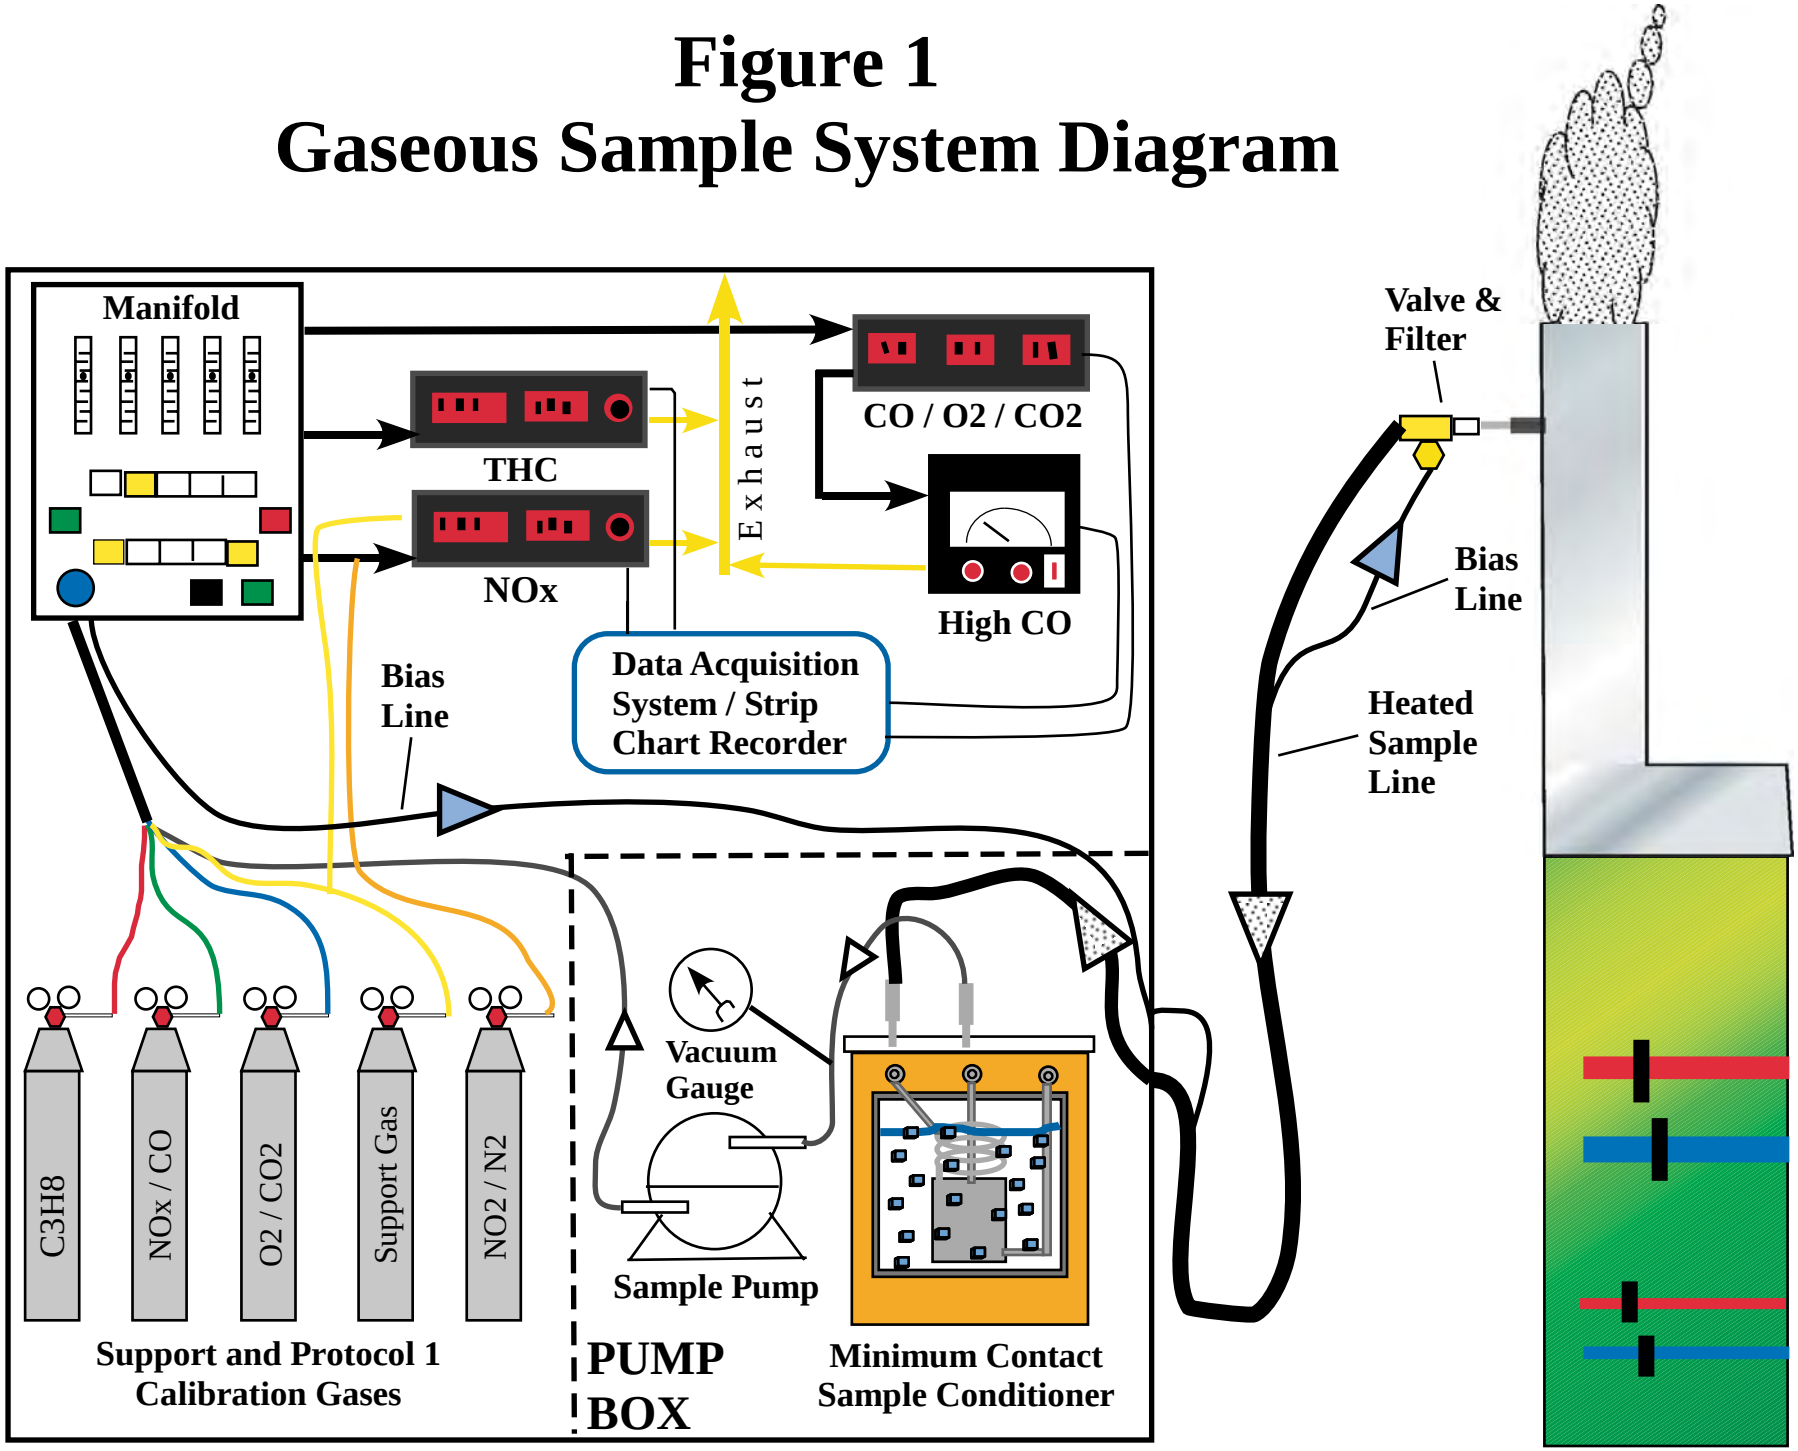
Figure 1 shows the sample system diagram used for the testing and Table 3 lists the analytical analyzers and sensitivities. Appendix A contains the engine, compressor, and control equipment operating data and tabular results compared with the emission limits along with the field data sheets. The load, horsepower, and turbine/generator operating parameters along with the analytical results are listed on the Summary of Results (SOR) page produced for the turbine. Also included on the SOR is the date of the test, location of unit, serial number, and calculated mass emission rates compared to the permitted limits. Appendix B contains the example calculations. Appendix C contains the fuel analysis and CST's fuel calculations and the fuel meter calibration data. Appendix D contains the quality assurance and quality control documentation. Appendix E contains the calibration gas certificate and the datalog record is in Appendix F.

Process Description



The turbine is a Siemens Energy SGT A35-DLE-GT centrifugal internal combustion engine that bears the serial number 1890D-2015. The turbine is rated for 24.6MW (32,989 Horsepower). The turbine is used to generate electricity for use at Los Alamos National Laboratory (LANL) or placing on the electrical grid for outside consumption.

Analytical Technique

Stack gas entered the instrumental sampling system through a stainless-steel probe placed into the stack with an in-line 90-micron filter and then was transported via 3/8-inch heat-traced Teflon® tubing to a specially designed stainless-steel minimum-contact condenser which dried the sample without removing the pollutants of interest. The sample was then passed to the gas manifold through 3/8" Teflon® tubing via a stainless steel/Teflon® diaphragm vacuum pump. The sample was partitioned to the analyzers through glass and stainless-steel rotameters that control the flow of the sample and did not allow a variance of more than 10% during the tests. The remaining gas was then vented outside of the climate-controlled laboratory. The gas manifold also allowed for the convenient introduction of calibration gases. Once the equipment was placed into the stack and hooked into the sampling manifold in the mobile laboratory, the desired ranges were selected by observing the stack effluents of interest. Each instrument was then calibrated, and the testing proceeded. All testing was performed from the stack centroid, each being bracketed by a zero and upscale analyzer drift calibration check.

Each test consisted of three consecutive twenty-minute test runs and was completed on-site. The stack gas analysis for O_2/CO_2 diluent concentrations were monitored with a paramagnetic detector and a non-dispersive infrared (NDIR) detector, respectively. NO_X emissions were quantified using a chemiluminescence detector and CO emission concentrations were quantified with an NDIR analyzer. This analyzer was equipped with a gas correlation filter, which also eliminates any interference from moisture, CO_2, and other combustion products. All gaseous data from the continuous monitoring instruments were recorded on an Omega OMB-DAQ-56 data acquisition system and was recorded at one-minute intervals. Each instrument was calibrated per protocol procedures and none were operated outside the acceptable variance limits. The volumetric flow rate was determined by EPA Method 19 and validated with a current fuel gas composition analysis and a calibrated fuel consumption meter. The volumetric flow rate was factored with the observed stack concentration and species-specific weight factors to derive the calculated mass emission rates. Details of these calculations are found in the example calculation section of the report.

Operating range is defined by the calibration gases used during the test (per EPA Methods 7e and 25b).

Quality Assurance Activities

Each instrument's response was checked and adjusted in the field prior to the collection of data via direct inject multi-point calibration. The instrument's linearity was checked by first adjusting the zero and span responses to zero (nitrogen) and an upscale calibration gas in the range of the expected concentrations. The instrument response was then challenged with other calibration gases of known concentration and accepted as being linear if the response of the other calibration gases agreed within ± 2% of span of the predicted values. Appendix D contains Instrumental Analysis Quality Assurance Worksheets, which summarize the results of these calibration error tests.

The sampling system's integrity was tested by comparing the responses of the analyzers to calibration gases introduced via two paths. The first path was into the analyzer via the zero/span calibration manifold. The second path was to introduce a calibration gas into the sample system at the sample probe. Any difference in the instrument responses by these two methods was attributed to sampling system bias or leakage. These bias checks were conducted before and after dismantling or setting up the sample system, and as required by the various methods. Examination of the datalog excerpt and Instrumental Analysis Quality Assurance Data worksheet in Appendix D show that the analyzer response via both sample paths agreed within acceptable limits in all cases.

Interference response tests on the NO_x, CO, CO_2, and O_2 instruments were conducted during the response time / bias check. The sum of the interference response for each analyzer is less than ± 5% of the applicable full-scale span value.

The efficiency of the NO_2 to NO converter in the NO_x analyzer was checked by introducing a certified mixture of NO_2 in N_2 standard gas into the analyzer. The criterion for acceptability is a demonstrated NO_x converter efficiency greater than 90%. The datalog excerpt that demonstrate the converter efficiency test are available in Appendix F. The above-mentioned quality assurance worksheets of Appendix D also summarize the results of the converter efficiency test.

The residence time of the sampling and measurement system was estimated using the pump flow rate and the sampling system volume. The pump's rated flow is 0.625 cfm at 10 psig. The sampling system volume is approximately 0.034 cf, therefore, the sample residence time is approximately 3.3 seconds. The sampling system purge time is twice of the longest response time, which is typically at or near 120 seconds.

Response time tests for individual instruments were conducted prior to sampling and noted in the Daily Assurance Worksheet of Appendix D and on the datalog record of Appendix F.

The control gases used to calibrate the instruments were analyzed and certified by the compressed gas vendors to ± 1% accuracy for the NO_x/CO, and O_2/CO_2 gases. EPA Protocol Number 1 was used, where applicable, to assign the concentration values traceable to the National Bureau of Standards, Standard Reference Materials (SRM's). The gas calibration sheets as prepared by the vendor are contained in Appendix E. The calibration certificate for the dry gas meter used is also contained in Appendix E.

Before and after the test, the analyzers were checked for zero and span drift. This allowed each test run to be bracketed by calibrations and documents the precision of the data just collected. The criterion for acceptable data is that the instrument drift is no more than ± 3% of the full-scale response. The quality assurance worksheets in Appendix D summarize all multi-point calibration checks and zero to span checks performed during the tests. These worksheets (as prepared from the datalog records of Appendix F) show that no drifts more than the criteria specified by the respective methods existed.

CST collected and reported the enclosed test data in accordance with the procedures and quality assurance activities described in this test report. CST makes no warranty as to the suitability of the test methods and assumes no liability relating to the interpretation and use of the test data.

Example Calculations

Drift Corrected Emission Concentrations

Formula

$$C_{GAS} = (Ç - Co) \times \frac{C_{MA}}{C_M - Co} \quad \textit{(eq. 7E-5)}$$

All Calculations Refer to Test Run 1, Unit # TA-3-22-CT-1

$Ç_{NOx}$ =	Raw Concentration of NOx	= 19.31 ppmv
Co =	Avg. of Initial and Final Zero Checks	= 0.09 ppmv
C_M =	Avg. of Initial and Final Span Checks	= 25.30 ppmv
C_{MA} =	Certified Concentration of Span Gas	= 25.00 ppmv

C_{NOx} = (19.31 - 0.09) x 25.00 / (25.30 - 0.09) = 19.06 ppmv

$Ç_{CO}$ =	Raw Concentration of CO	= 4.66 ppmv
Co =	Avg. of Initial and Final Zero Checks	= -0.33 ppmv
C_M =	Avg. of Initial and Final Span Checks	= 24.79 ppmv
C_{MA} =	Certified Concentration of Span Gas	= 25.00 ppmv

C_{CO} = (4.66 + 0.33) x 25.00 / (24.79 + 0.33) = 4.96 ppmv

$Ç_{O2}$ =	Raw Concentration of O2	= 14.83 %
Co =	Avg. of initial and final zero bias checks	= 0.01%
C_M =	Avg. of initial and final span bias checks	= 10.00%
C_{MA} =	Actual concentration of span gas	= 10%

C_{O2} = (14.83 - 0.01) x 10.00 / (10.00 - 0.01) = 14.83%

$Ç_{CO2}$ =	Raw Concentration of CO2	= 3.47%
Co =	Avg. of initial and final zero bias checks	= 0.20%
C_M =	Avg. of initial and final span bias checks	= 5.02%
C_{MA} =	Actual concentration of span gas	= 5.00%

C_{CO2} = (3.47 - 0.20) x 5.00 / (5.02 - 0.20) = 3.40%

Fo Calculation to Verify O2 / CO2 Measurements (Eq. 3b-1)

C_{O2} =	Corrected Concentration of O2	= 14.83%
C_{CO2} =	Corrected Concentration of CO2	= 3.40%
Th. Fo =	Theoretical Fo from FGA	= 1.76

$$Fo = \frac{(20.9 - O2\%)}{CO2\%}$$

$$\mathbf{Fo} = \frac{(20.9 - 14.83)}{3.40} = \mathbf{1.79}$$

Adjust Measured Concentrations to 15% O2 (Eq. 60.335)

$$\mathbf{C_X @ 15\% O2} = C_X\,(ppmv) \times \frac{5.9}{(20.9 - O2\%)}$$

$$\mathbf{C_{NOx} @ 15\% O2} = 19.06 \times \frac{5.9}{(20.9 - 14.83)} = \mathbf{18.53} \ \mathbf{@ 15\% O2}$$

Calibration Date: 2/9/22
Next Calibration Date: 2/9/23
Technician: MW

The mass flow controllers (MFC) in use with this gas dilution system was calibrated with a Bios Defender Model 530 High Flow. This calibration was performed with nitrogen and was corrected to standard reference temperature (68° F) and pressure (29.92" Hg). The data shown is performance data taken after the calibration of the gas dilution system. Acceptable criteria for pass/fail is a true flow value +/- 10% within the set flow.

Data Summary:

All sample data provided in this report met the acceptance criteria specified in the analytical methods and procedures for initial calibration, continuing calibration, instrument controls and process controls where applicable, with the following exceptions.

Calibration Information

Continuing Calibration Verification Requirements
All Calibration Verification Standards (CCV) did not meet the acceptance criteria as outlined in Method 8260D for samples and the associated QC. However, the method allows for a designated number of outliers dependent on the requested analyte list. This SDG satisfied the 8260D outlier acceptance criteria. The results are reported.

Quality Control (QC) Information

Blank (MB) Statement
Target analytes were detected in the blank 1205275617 (MB) below the reporting limit. The data are qualified and reported.

Laboratory Control Sample (LCS) Recovery
The LCS/and or LCSD (See Below) recovery was not within the acceptance limits for all analytes. The unacceptable analyte was not detected in the samples associated with the laboratory control sample. Therefore, the data were reported.

Sample	Analyte	Value
1205275615 (LCS)	Benzene	119* (74%-118%)
	Bromoform	138* (69%-130%)

Matrix Spike/Matrix Spike Duplicate Recovery Statement
The spike and/or spike duplicate (See Below) recoveries were not all within the acceptance limits. The recoveries were similar. It is believed possible matrix interference has been demonstrated.

Sample	Analyte	Value
1205275618 (SMEB01-23-265371PS)	Benzene	128* (65%-122%)
1205275619 (SMEB01-23-265371PS)	Acrolein	3* (51%-142%)
1205275620 (SMEB01-23-265371PSD)	Benzene	125* (65%-122%)
1205275621 (SMEB01-23-265371PSD)	Acrolein	3* (51%-142%)

The spike and/or spike duplicate (See Below) recoveries were not all within the acceptance limits. The associated spike and/or spike duplicate passed recoveries near the lower/upper end of the limits.

Sample	Analyte	Value
1205275618 (SMEB01-23-265371PS)	Toluene	124* (63%-121%)

Relative Percent Difference (RPD) Statement
The RPD between the matrix spike pair (See Below) were not all within the acceptance limits. The unacceptable RPD may be attributed to matrix interference and/or sample non-homogeneity.

Sample	Analyte	Value
1205275619PS and 1205275621PSD (SMEB01-23-265371)	Acrolein	RPD 28* (0%-20%)

The RPD between the matrix spike pair (See Below) were not all within the acceptance limits. However, the spike recoveries passed. The unacceptable RPD may be attributed to matrix interference and/or sample non-homogeneity.

Sample	Analyte	Value
1205275619PS and 1205275621PSD (SMEB01-23-265371)	Acrylonitrile	RPD 22* (0%-20%)

Technical Information

Sample Re-extraction/Re-analysis
Samples 1205275618 (SMEB01-23-265371PS), 1205275620 (SMEB01-23-265371PSD), 604449002 (SMEB01-23-265371) and 604449006 (SMEB02-23-265372) were reanalyzed due to unacceptable LCS recoveries in the initial analysis. The re-analyses passed and are reported.

Miscellaneous Information

TIC Comment

Tentatively identified compounds (TIC) were requested for samples 604449002 (SMEB01-23-265371), 604449003 (SMEB01-23-265376), 604449006 (SMEB02-23-265372), 604449007 (SMEB02-23-265377), 604449010 (SMEB03-23-265373), 604449011 (SMEB03-23-265378), 604449014 (SMEB04-23-265374), 604449015 (SMEB04-23-265379), 604449018 (SMEB05-23-265375) and 604449019 (SMEB05-23-265380) in this delivery group/work order. Please note that non-requested calibrated analytes detected in a client sample may be reported on the Form 1/Certificate of Analysis as TICs. TIC data, if requested, were included on the Sample Data Summary (Form 1) and included with the sample raw data.

Certification Statement

Where the analytical method has been performed under NELAP certification, the analysis has met all of the requirements of the NELAC standard unless otherwise noted in the analytical case narrative.

Data Summary:

All sample data provided in this report met the acceptance criteria specified in the analytical methods and procedures for initial calibration, continuing calibration, instrument controls and process controls where applicable, with the following exceptions.

Quality Control (QC) Information

Surrogate Recoveries
Samples (See Below) did not meet surrogate recovery limits. The samples were described as being very emulsive during extraction and the extracts were dark green in color. Following analysis, the GC/MS required extensive maintenance and column rinsing in order to restore adequate response for various acid compounds, particularly pentachlorophenol. It appears the low surrogate recoveries are associated with the matrix of the samples and the samples were not re-extracted.

Sample	Analyte	Value

	Phenol-d5	343* (15%-85%)
	p-Terphenyl-d14	13* (24%-129%)

Laboratory Control Sample (LCS) Recovery
The LCS and/or LCSD (See Below) did not meet spike recovery acceptance criteria. The failures are known to be poor responding analytes as stated per the Method. This may account for the low recoveries and the data were reported.

Sample	Analyte	Value
1205274621 (LCS)	1, 4-Dioxane	41* (43%-70%)
	Hexachlorocyclopentadiene	26* (30%-95%)

Spike Recovery Statement
The MS or MSD (See Below) spike recoveries were not within the acceptance limits. The MS and MSD were analyzed at a dilution. As a result, the spikes were diluted outside of the acceptance limits.

Sample	Analyte	Value
1205274624 (SMEB02-23-265372MS)	2, 4, 5-Trichlorophenol	46* (49%-125%)
	2, 4, 6-Trichlorophenol	41* (47%-130%)
	2, 4-Dichlorophenol	41* (49%-119%)
	3, 3’-Dichlorobenzidine	0* (38%-130%)
	Benzidine	0* (8%-128%)
	Hexachlorocyclopentadiene	0* (18%-89%)
	Isophorone	36* (42%-116%)
	N-Nitrosopyrrolidine	50* (52%-127%)
1205274625 (SMEB02-23-265372MSD)	3, 3’-Dichlorobenzidine	0* (38%-130%)
	Benzidine	0* (8%-128%)
	Hexachlorocyclopentadiene	7* (18%-89%)

MS/MSD Relative Percent Difference (RPD) Statement
The RPD values between the MS and MSD, (See Below), were not within the acceptance limits due to the large difference between the individual recoveries in each MS and MSD analyte pair. The failures may be attributed to an error in the extraction process.

Sample	Analyte	Value
1205274624MS and 1205274625MSD (SMEB02-23-265372)	2, 4-Dichlorophenol	RPD 66* (0%-42%)
	2, 4-Dinitrotoluene	RPD 47* (0%-42%)
	Atrazine	RPD 48* (0%-42%)
	Hexachlorocyclopentadiene	RPD 200* (0%-92%)
	Isophorone	RPD 48* (0%-43%)
	N-Nitrosopyrrolidine	RPD 41* (0%-36%)

Technical Information

Sample Dilutions
Samples 1205274624 (SMEB02-23-265372MS), 1205274625 (SMEB02-23-265372MSD), 604449002 (SMEB01-23-265371), 604449006 (SMEB02-23-265372), 604449010 (SMEB03-23-265373) and 604449018 (SMEB05-23-265375) were diluted because the extracts were very dark and/or viscous. The data from the dilutions are reported.

Miscellaneous Information

TIC Comment
Tentatively identified compounds (TIC) were requested for samples 604449002 (SMEB01-23-265371), 604449006 (SMEB02-23-265372), 604449010 (SMEB03-23-265373), 604449014 (SMEB04-23-265374) and 604449018 (SMEB05-23-265375) in this SDG in this batch.

Additional Comments
Diphenylamine Statement
Diphenylamine has superseded the reporting of N-Nitroso-diphenylamine. As per the EPA, N-Nitroso-diphenylamine decomposes in the gas chromatographic inlet and cannot be separated from Diphenylamine. Studies of these two compounds at GEL, both independent of each other and together, showed that they not only co-elute, but also have similar mass spectra. N-Nitroso-diphenylamine and Diphenylamine are therefore reported as Diphenylamine on all reports and forms.

Certification Statement

Where the analytical method has been performed under NELAP certification, the analysis has met all of the requirements of the NELAC standard unless otherwise noted in the analytical case narrative.

Data Summary:

All sample data provided in this report met the acceptance criteria specified in the analytical methods and procedures for initial calibration, continuing calibration, instrument controls and process controls where applicable, with the following exceptions.

Calibration Information

Calibration Verification Standard Requirements
All continuing calibration verification standards (CCV) have not met requirements of 80-120% for in this SDG. Please refer to Form 7 of the data package for a list of recoveries. The standard bracketing these samples recovered outside the acceptance range. The samples were analyzed three (3) times on different instruments and similar failures were observed. 604449002 (SMEB01-23-265371), 604449006 (SMEB02-23-265372), 604449010 (SMEB03-23-265373), 604449014 (SMEB04-23-265374) and 604449018 (SMEB05-23-265375).

CRI Requirements
All Low Level Calibration Verification Standards (CRI) did not meet requirements of 70-130% for samples in this SDG. Please refer to Form 7 of the data package for a list of recoveries. The Low Level standard bracketing these samples recovered outside the acceptance range. The samples were analyzed three (3) times on different instruments and similar failures were observed. 604449002 (SMEB01-23-265371), 604449006 (SMEB02-23-265372), 604449010 (SMEB03-23-265373), 604449014 (SMEB04-23-265374) and 604449018

(SMEB05-23-265375).

Technical Information

Sample Dilutions
In accordance with GEL SOP GL-OA-056, all sample and QC extracts are diluted 1:1 v/v with LC reagent grade Water.

Certification Statement

Where the analytical method has been performed under NELAP certification, the analysis has met all of the requirements of the NELAC standard unless otherwise noted in the analytical case narrative.

Please refer to Form 8 of the data package for a complete list of Internal Standard Recoveries.

Relative Retention Time (RRT) is used by the laboratory to establish peak identity. The RRT of each target analyte is calculated using the retention time of the corresponding internal standard. The RRT of each analyte in a sample must be within 2.0 of the analyte's calculated RRT in the ICV.

Data Summary:

All sample data provided in this report met the acceptance criteria specified in the analytical methods and procedures for initial calibration, continuing calibration, instrument controls and process controls where applicable, with the following exceptions.

Quality Control (QC) Information

Surrogate Recoveries
Samples (See Below) did not meet acceptance criteria for surrogate recovery due to dilution.

Sample	Analyte	Value
1205274611 (SMEB01-23-265371MS)	4cmx	151* (27%-111%)
604449002 (SMEB01-23-265371)	4cmx	142* (27%-111%)

	Decachlorobiphenyl	20* (33%-129%)
	Decachlorobiphenyl	25* (33%-129%)

Matrix Spike (MS/MSD) Recovery Statement
The matrix QC samples (See Below) did not meet spike recovery acceptance limits due to dilution.

Sample	Analyte	Value
1205274611 (SMEB01-23-265371MS)	4, 4'-DDT	32* (36%-139%)
	Aldrin	0* (13%-126%)
1205274612 (SMEB01-23-265371MSD)	4, 4'-DDT	25* (36%-139%)
	Aldrin	0* (13%-126%)

MS/MSD Relative Percent Difference (RPD) Statement
The RPD values between the MS and MSD, (See Below), were not within the acceptance limits due to the large difference between the individual recoveries in each MS and MSD analyte pair.

Sample	Analyte	Value
1205274611MS and 1205274612MSD (SMEB01-23-265371)	Dieldrin, Endosulfan II	36* (0%-30%)

Technical Information

Preparation/Analytical Method Verification
Samples and the associated QC in this batch were cleaned with activated copper in order to remove sulfur.

Sample Dilutions
Samples 1205274611 (SMEB01-23-265371MS), 1205274612 (SMEB01-23-265371MSD), 604449002 (SMEB01-23-265371), 604449006 (SMEB02-23-265372), 604449010 (SMEB03-23-265373), 604449014 (SMEB04-23-265374) and 604449018 (SMEB05-23-265375) were diluted due to high concentrations of non-target analytes within the retention time window of interest.

Florisil
Florisil clean-up was not performed on client and quality control samples in this batch.

Miscellaneous Information

Manual Integrations
Samples 1205274611 (SMEB01-23-265371MS), 1205274612 (SMEB01-23-265371MSD), 1205274619 (LCS), 604449002 (SMEB01-23-265371) and 604449006 (SMEB02-23-265372) required manual integration to correctly position the baseline as set in the calibration standard injections.

Certification Statement

Where the analytical method has been performed under NELAP certification, the analysis has met all of the requirements of the NELAC standard unless otherwise noted in the analytical case narrative.

Qualifier Definition Report
for

TNSL001 Triad National Security, LLC (620266)

Client SDG: 2023-289 GEL Work Order: 604449

The Qualifiers in this report are defined as follows:

* A quality control analyte recovery is outside of specified acceptance criteria
** Analyte is a surrogate compound
J Value is estimated
P Organics--The concentrations between the primary and confirmation columns/detectors is >40% different. For HPLC, the difference is >70%.
U Analyte was analyzed for, but not detected above the MDL, MDA, MDC or LOD.

DL Indicates that sample is diluted.
RA Indicates that sample is re-analyzed without re-extraction.
RE Indicates that sample is re-extracted.

Review/Validation

GEL requires all analytical data to be verified by a qualified data reviewer. In addition, all CLP-like deliverables receive a third level review of the fractional data package.
