Hi Carina,

Good morning.

Thank you for the forms.

I do have one question. LANL's monitoring report attachments are 1500-1700 pages long. The previous compliance manager, Renae Held allowed us to submit electronic files only for the attachments. Is this acceptable to you? We will submit paper copies for the submittal form, certification form and the report. We would like to avoid printing so many pages.

Let me know.

Thank you again for your help with this.

Subject: Template for Los Alamos National Laboratory's semi-annual monitoring report

Hi Carina,

We spoke a month ago about getting a new template for the semi-annual monitoring report for Title V permit P100-R2M1.
I was wondering if the template is available so that I can get started on the monitoring report.

The AI for LANL is AI856.

Until Feb 3, 2017 LANL operated under permit P100-R2.
On Feb 3, 2017, LANL was issued a permit modification P100-R2M1. The modification was for the addition of Evaporative Sprayers in Section A1500.

Would you kindly let me know if LANL has to submit two monitoring reports or one for the Jan 1–Jun 30, 2017 monitoring period?

I will follow up this e-mail with a phone call to you.

Thank you.

With best regards,

Brinda Ramanathan

Title V Semi - Annual Monitoring Report for Permits P100-R2M4

Part 1 – Monitoring Activity Reporting Requirements

A Semi-Annual Report of monitoring activities is due within 45 days following the end of every 6-month reporting period. The six month reporting periods start on January 1st and July 1st of each year.

A responsible official (as defined in 20.2.70.7.AE NMAC) shall certify the accuracy, truth and completeness of every report and compliance certification submitted to the Department as required by this permit. These certifications shall be part of each document. (20.2.70.300.E NMAC)

Compliance Certification Reports, Semi-Annual monitoring reports, compliance schedule progress reports, and any other compliance status information required by this permit shall be certified by the responsible official and submitted to:

Manager, Compliance and Enforcement Section
New Mexico Environment Department
Air Quality Bureau
525 Camino De Los Marquez, Suite 1
Santa Fe, NM 87505-1816

B108 General Monitoring Requirements

(20.2.70. 302.A and C NMAC)

A. These requirements do not supersede or relax requirements of federal regulations.

B. The following monitoring and/or testing requirements shall be used to determine compliance with applicable requirements and emission limits. Any sampling, whether by portable analyzer or EPA reference method, that measures an emission rate over the applicable averaging period greater than an emission limit in this permit constitutes noncompliance with this permit. The Department may require, at its discretion, additional tests pursuant to EPA Reference Methods at any time, including when sampling by portable analyzer measures an emission rate greater than an emission limit in this permit; but such requirement shall not be construed as a determination that the sampling by portable analyzer does not establish noncompliance with this permit and shall not stay enforcement of such noncompliance based on the sampling by portable analyzer.

C. If the emission unit is shutdown at the time when periodic monitoring is due to be accomplished, the permittee is not required to restart the unit for the sole purpose of performing the monitoring. Using electronic or written mail, the permittee shall notify the Department's Enforcement Section of a delay in emission tests prior to the deadline for accomplishing the tests. Upon recommencing operation, the permittee shall submit any pertinent pre-test notification requirements set forth in the current version of the Department's Standard Operating Procedures For Use Of Portable Analyzers in Performance Test, and shall accomplish the monitoring.

D. The requirement for monitoring during any monitoring period is based on the percentage of time that the unit has operated. However, to invoke monitoring period exemptions at B108.D(2), hours of operation shall be monitored and recorded.

   (1) If the emission unit has operated for more than 25% of a monitoring period, then the permittee shall conduct monitoring during that period.

   (2) If the emission unit has operated for 25% or less of a monitoring period then the monitoring is not required. After two successive periods without monitoring, the permittee shall conduct monitoring during the next period regardless of the time operated during that period, except that for any monitoring period in which a unit has operated for less than 10% of the monitoring period, the period will not be considered as one of the two successive periods.

   (3) If invoking the monitoring period exemption in B108.D(2), the actual operating time of a unit shall not exceed the monitoring period required by this permit before the required monitoring is performed. For example, if the monitoring period is annual, the operating hours of the unit shall not exceed 8760 hours before monitoring is conducted. Regardless of the time that a unit actually operates, a minimum of one of each type of monitoring activity shall be conducted during the five year term of this permit.

E. The permittee is not required to report a deviation for any monitoring or testing in a Specific Condition if the deviation was authorized in this General Condition B108.

F. For all periodic monitoring events, except when a federal or state regulation is more stringent, three test runs shall be conducted at 90% or greater of the unit's capacity as stated in this permit, or in the permit application if not in the permit, and at additional loads when requested by the Department. If the 90% capacity cannot be achieved, the monitoring will be conducted at the maximum

achievable load under prevailing operating conditions except when a federal or state regulation requires more restrictive test conditions. The load and the parameters used to calculate it shall be recorded to document operating conditions and shall be included with the monitoring report.

G. When requested by the Department, the permittee shall provide schedules of testing and monitoring activities. Compliance tests from previous NSR and Title V permits may be re-imposed if it is deemed necessary by the Department to determine whether the source is in compliance with applicable regulations or permit conditions.

H. If monitoring is new or is in addition to monitoring imposed by an existing applicable requirement, it shall become effective 120 days after the date of permit issuance. For emission units that have not commenced operation, the associated new or additional monitoring shall not apply until 120 days after the units commence operation. All pre-existing monitoring requirements incorporated in this permit shall continue to apply from the date of permit issuance. All monitoring periods, unless stated otherwise in the specific permit condition or federal requirement, shall commence at the beginning of the 12 month reporting period as defined at condition A109.B.

B109 General Recordkeeping Requirements

(20.2.70.302.D NMAC)

A. The permittee shall maintain records to assure and verify compliance with the terms and conditions of this permit and any applicable requirements that become effective during the term of this permit. The minimum information to be included in these records is (20.2.70.302.D.1 NMAC):
   (1) equipment identification (include make, model and serial number for all tested equipment and emission controls);
   (2) date(s) and time(s) of sampling or measurements;
   (3) date(s) analyses were performed;
   (4) the company or entity that performed the analyses;
   (5) analytical or test methods used;
   (6) results of analyses or tests; and
   (7) operating conditions existing at the time of sampling or measurement.

B. The permittee shall keep records of all monitoring data, equipment calibration, maintenance, and inspections, Data Acquisition and Handling System (DAHS) if used, reports, and other supporting information required by this permit for at least five (5) years from the time the data was gathered or the reports written. Each record shall clearly identify the emissions unit and/or monitoring equipment, and the date the data was gathered. (20.2.70.302.D.2 NMAC)

C. If the permittee has applied and received approval for an alternative operating scenario, then the permittee shall maintain a log at the facility, which documents, contemporaneously with any change from one operating scenario to another, the scenario under which the facility is operating. (20.2.70.302.A.3 NMAC)

D. The permittee shall keep a record describing off permit changes made at this source that result in emissions of a regulated air pollutant subject to an applicable requirement, but not otherwise regulated under this permit, and the emissions resulting from those changes. (20.2.70.302.I.2 NMAC)

E. Unless otherwise indicated by Specific Conditions, the permittee shall keep the following records for malfunction emissions and routine and predictable emissions during startup, shutdown, and scheduled maintenance (SSM):

(1) The owner or operator of a source subject to a permit, shall establish and implement a plan to minimize emissions during routine or predictable startup, shutdown, and scheduled maintenance through work practice standards and good air pollution control practices. This requirement shall not apply to any affected facility defined in and subject to an emissions standard and an equivalent plan under 40 CFR Part 60 (NSPS), 40 CFR Part 63 (MACT), or an equivalent plan under 20.2.72 NMAC - Construction Permits, 20.2.70 NMAC - Operating Permits, 20.2.74 NMAC - Permits - Prevention of Significant Deterioration (PSD), or 20.2.79 NMAC - Permits - Nonattainment Areas. (20.2.7.14.A NMAC) The permittee shall keep records of all sources subject to the plan to minimize emissions during routine or predictable SSM and shall record if the source is subject to an alternative plan and therefore, not subject to the plan requirements under 20.2.7.14.A NMAC.

(2) If the facility has allowable SSM emission limits in this permit, the permittee shall record all SSM events, including the date, the start time, the end time, a description of the event, and a description of the cause of the event. This record also shall include a copy of the manufacturer's, or equivalent, documentation showing that any maintenance qualified as scheduled. Scheduled maintenance is an activity that occurs at an established frequency pursuant to a written protocol published by the manufacturer or other reliable source. The authorization of allowable SSM emissions does not supersede any applicable federal or state standard. The most stringent requirement applies.

(3) If the facility has allowable malfunction emission limits in this permit, the permittee shall record all malfunction events to be applied against these limits. The permittee shall also include the date, the start time, the end time, and a description of the event. **Malfunction means** any sudden and unavoidable failure of air pollution control equipment or process equipment beyond the control of the owner or operator, including malfunction during startup or shutdown. A failure that is caused entirely or in part by poor maintenance, careless operation, or any other preventable equipment breakdown shall not be considered a malfunction. (20.2.7.7.E NMAC) The authorization of allowable malfunction emissions does not supersede any applicable federal or state standard. The most stringent requirement applies. This authorization only allows the permittee to avoid submitting reports under 20.2.7 NMAC for total annual emissions that are below the authorized malfunction emission limit.

(4) The owner or operator of a source shall meet the operational plan defining the measures to be taken to mitigate source emissions during malfunction, startup or shutdown. (20.2.72.203.A(5) NMAC)

B110 General Reporting Requirements

(20.2.70.302.E NMAC)

A. Reports of required monitoring activities for this facility shall be submitted to the Department on

the schedule in section A109. Monitoring and recordkeeping requirements that are not required by a NSPS or MACT shall be maintained on-site or (for unmanned sites) at the nearest company office, and summarized in the semi-annual reports, unless alternative reporting requirements are specified in the equipment specific requirements section of this permit.

B. Reports shall clearly identify the subject equipment showing the emission unit ID number according to this operating permit. In addition, all instances of deviations from permit requirements, including those that occur during emergencies, shall be clearly identified in the reports required by section A109. (20.2.70.302.E.1 NMAC)

C. The permittee shall submit reports of all deviations from permit requirements, including those attributable to upset conditions as defined in the permit, the probable cause of such deviations, and any corrective actions or preventive measures taken. These reports shall be submitted as follows:
   (1) Deviations resulting in excess emissions as defined in 20.2.7.7 NMAC (including those classified as emergencies as defined in section B114.A) shall be reported in accordance with the timelines specified by 20.2.7.110 NMAC and in the semi-annual reports required in section A109. (20.2.70.302.E.2 NMAC)
   (2) All other deviations shall be reported in the semi-annual reports required in section A109. (20.2.70.302.E.2 NMAC).

D. The permittee shall submit reports of excess emissions in accordance with 20.2.7.110.A NMAC.

E. Results of emission tests and monitoring for each pollutant (except opacity) shall be reported in pounds per hour (unless otherwise specified) and tons per year. Opacity shall be reported in percent. The number of significant figures corresponding to the full accuracy inherent in the testing instrument or Method test used to obtain the data shall be used to calculate and report test results in accordance with 20.2.1.116.B and C NMAC. Upon request by the Department, CEMS and other tabular data shall be submitted in editable, MS Excel format.

F. At such time as new units are installed as authorized by the applicable NSR Permit, the permittee shall fulfill the notification requirements in the NSR permit.

G. Periodic Emissions Test Reporting: The permittee shall report semi-annually a summary of the test results.

H. The permittee shall submit an emissions inventory for this facility annually. The emissions inventory shall be submitted by the later of April 1 or within 90 days after the Department makes such request. (20.2.73 NMAC and 20.2.70.302.A.1 NMAC)

I. Emissions trading within a facility (20.2.70.302.H.2 NMAC)
   (1) For each such change, the permittee shall provide written notification to the department and the administrator at least seven (7) days in advance of the proposed changes. Such notification shall state when the change will occur and shall describe the changes in emissions that will result and how these increases and decreases in emissions will comply with the terms and conditions of the permit.
   (2) The permittee and department shall attach each such notice to their copy of the relevant permit.

FACILITY SPECIFIC REQUIREMENTS:

A109 Facility: Reporting B. A Semi-Annual Report of actual emissions from all permitted sources unless otherwise specified in this permit is due within 90 days following the end of every 6-month reporting period as defined at Condition A109.A. 3) The emission rates are based on the emission factor for NOx (lb/MMscf), which is 58 lb/MMscf, this emission factor is an average of source tests conducted on all 3 boilers in September 2002 burning natural gas after flue gas recirculation (FGR) installed. This factor is converted to lbs/MMBtu by dividing by the high heat value of natural gas (the number of Btu in a scf). As the HHV of natural gas ranges in value, the following emission range was calculated using the low and high values at LANL between 2011 and 2022, the lowest was 939.97 Btu/scf and the highest was 1079.3 Btu/scf, therefore the NOx emission rate will range from 0.0537 to 0.0617 lbs/MMBtu. These NOx emission rates are well below the 0.3 lb/MMBtu heat input limit in A1302.B.

Recordkeeping: Records are maintained in accordance with Section B109.

Reporting: Emissions and monitoring reports are submitted on a semi-annual basis and compliance certification on an annual basis in accordance with permit conditions A109 and B110. For more information, see comments in Section A605 of this report.

1.0 PRE-MAINTENANCE ACTIVITIES

NOTE Preoperational and pre-maintenance activities shall be conducted per the work order package, e.g., lockout/tagout, permits, special instructions, etc.

! WARNING If purging of gas lines will be required during this maintenance, ensure that the purging activity is addressed in the Integrated Work Document (IWD). The following must be addressed (see Master Specification 23 1123):

1. Purged fuel gases shall be directly vented to a safe location outdoors, away from personnel and ignition sources. This may be accomplished through permanent piping or temporary piping or hosing.
2. If it is not possible to vent purged gases outdoors, the following conditions must be met:
   a. Purging activity must be approved by the LANL Fire Marshal based on a documented justification detailing why outdoor venting is not possible and IWD.
   b. Gas concentration in the space to which the purge is vented shall be maintained at no more than 25% of the Lower Explosive Limit (LEL). For natural gas, the LEL is a concentration of 5% in air or 50,000 ppm. Therefore a maximum concentration of 12,500 ppm is allowed for natural gas. The concentration may be controlled by providing adequate ventilation or by limiting the amount of purge gas.
   c. Combustible gas detectors shall be used during the purging operation to monitor the gas concentration.
   d. Nonessential personnel shall be evacuated from the vicinity (including adjacent spaces) during the purging operation.
   e. Ignition sources in the purging space shall be controlled or eliminated.

NOTE All repair work, adjustments, or the replacement of parts shall be done in accordance with the manufacturer's procedures, specifications, recommendations, and instructions.

1.0 PRE-MAINTENANCE ACTIVITIES

NOTE Preoperational and pre-maintenance activities shall be conducted per the work order package, e.g., lockout/tagout, permits, special instructions, etc.

! WARNING If purging of gas lines will be required during this maintenance, ensure that the purging activity is addressed in the Integrated Work Document (IWD). The following must be addressed (see Master Specification 23 1123):

1. Purged fuel gases shall be directly vented to a safe location outdoors, away from personnel and ignition sources. This may be accomplished through permanent piping or temporary piping or hosing.
2. If it is not possible to vent purged gases outdoors, the following conditions must be met:
   a. Purging activity must be approved by the LANL Fire Marshal based on a documented justification detailing why outdoor venting is not possible and IWD.
   b. Gas concentration in the space to which the purge is vented shall be maintained at no more than 25% of the Lower Explosive Limit (LEL). For natural gas, the LEL is a concentration of 5% in air or 50,000 ppm. Therefore a maximum concentration of 12,500 ppm is allowed for natural gas. The concentration may be controlled by providing adequate ventilation or by limiting the amount of purge gas.
   c. Combustible gas detectors shall be used during the purging operation to monitor the gas concentration.
   d. Nonessential personnel shall be evacuated from the vicinity (including adjacent spaces) during the purging operation.
   e. Ignition sources in the purging space shall be controlled or eliminated.

NOTE All repair work, adjustments, or the replacement of parts shall be done in accordance with the manufacturer's procedures, specifications, recommendations, and instructions.

Additional Comments

ACCESS CONTROL: Work within the TA-16 HE Area requires check-in first with TA-16 ACO at TA-16 Building 969. The single most important requirement that all personnel must understand is that a closed gate or other barrier must never be crossed.

CAUTION: This area is a High Explosives (HE) Area. Work group shall adhere to all local ACO instructions as to where access is allowed and where it is restricted, e.g. areas around HE facilities and magazines.

CAUTION: Non-TRIAD workers (outside contractors) require a HE waiver (see P101-8) to work within intraline distance of High Explosive materials if work takes longer than 8 hours.

PIC Pre-Job Brief Instructions:

For all Low and Moderate Hazard work activities, the PIC shall perform a pre-job brief prior to work start and for any new member of the work group prior to that member beginning work. For all High Hazard activities, the PIC shall perform a pre-job brief prior to work start on EVERY Day/Shift of the activity and for any new member of the work group prior to that member beginning work.

ABNORMAL EVENTS: Any injury, accident, spill, off normal occurrence, etc. MUST be reported immediately to the WFO-FOD Duty Officer @ 664-2926 AND TA-16 Access Control Office 7-9192

LANL TA-9/16 boiler Inspections:

Summer 2022:

Overall, the boilers are still in excellent condition. There is virtually no scale on the boiler tubes, so the heat transfer is outstanding. The exposed steel is in various conditions with the majority showing dark red to dark grey surfaces. You are on your way to developing magnetite at every boiler. MANY THANKS TO JASON AND HIS CREW FOR ALL OF THE HARD WORK!

TA-9 Boilers A and B

Boiler A: There are no heat transfer issues since the tubes are all clean. The tubes are mostly covered with rust, probably from high levels of iron in the condensate or possibly flash rush when the boiler was opened and exposed to oxygen. There are no safety or operational issues.

Boiler B: The tubes looked the same as boiler A with the addition of numerous tubercules (looks like flash oxygen pitting). The pits are extremely shallow, almost non-existent. We are not sure what is causing that condition. We saw the same items last summer.

The make-up tank was had as much as 1/2'" of mud in it but there was no corrosion evident in the tank. Similar to last year.

16-1490 Boilers A and B:

Boiler A: Almost perfect! There is flat black on the tubes, top and bottom. Otherwise, there was no scale seen just shiny bare metal.

Boiler B: The tops of the tubes were virtually identical to Boiler A. As you look through the lower holes you see that the tubes have a very light gray color. It is still bare iron but the color changes a bit. Nothing to be concerned about. Both boilers looked excellent

The make-up tank had a light mud coating in the bottom. There was a small area on the East side of the tank that had some corrosion tubercules. They were not severe.

16-1491 Boilers A and B:

Boiler A: Very clean. The steel tubes were mostly black magnetite. No safety or heat transfer concerns. I could not see the back of the tubes because the head was not open, but it was obvious that the boiler is really clean. It looked excellent!

Boiler B: Again, basically clean, and similar Boiler A. The front had no mud and was magnetite black. I couldn't see the back or bottom of the tubes. Excellent!

The make-up tank was coated with dried slime and had about ½ inch of sludge before it was cleaned. There are a few tubercles evident indicating some corrosion but it appears to be minor.

16-1492 Boilers A and B:

Boiler A: The tubes are all steel with a slight red tint and no scale seen. No safety or efficiency issues just some iron returning in the condensate.

Boiler B: Almost identical to Boiler A but had slightly less of a red tint and is not turning blacker. Again, just some iron returning to the boiler in the condensate is causing the red tint.

The make-up tank had about ¼" to ½" of mud returning with the condensate.

16-1484 Boiler A and B:

Boiler A: The tubes are perfect virtually perfect. The tubes are all very red from condensate return but there is no scale anywhere. No safety or efficiency concerns.

Boiler B: The tubes look just like Boiler A, very clean with a definite red tint.

The make-up tank was clean but there are pits all over the bottom of the tank. Some appear to be relatively deep.

16-1480 Boilers A and B:

Boiler A: Still has good steel surfaces dark purple tops and black bottoms with some powder seen which would be from the water drying during the shut-down and opening. There are no safety or efficiency concerns.

Boiler B: The tubes were smooth with mostly blue and black surfaces. The bottoms of the tubes had rough, ripples of scale but still generally clean.

The make-up tank had ¼" to ½" of deposits. There is also some corrosion evident on one of the side walls. It appears to be minor but you might want to check it out.

16-1483 Boiler A:

The boiler looks the same as last year, great with mostly black magnetite. Some powder was left behind from the drying water during shut down but is not an issue. The bottoms of the tubes have now changed to mostly black. There are no safety concerns or efficiency problems.

16-1487 Boiler A: There is no scale evident, just bare steel throughout the tubes. The tubes have a red coloring to them probably due to iron returning in the condensate. No tubercles are on the tubes this year.

Boiler B: Again, the tubes are entirely exposed steel with no scale. The tubes are all black. Everything looks great!

SECTION VI – DEFICIENCIES SUMMARY

1) No leak test valve downstream of first SSOV as required by ASME CSD-1, CF-150(h) & CF-180(i)
2) The diaphragm gas pressure regulator for pilot line is vented to the boiler room and not outside the boiler room as required per ASME CSD-1, CF-190(a)(1).
3) The pressure gage range (0-100) is less than permitted based on the SRV (safety relief valve) set pressure per ASME Code, Section IV, HG-611(b).
4) There is a water heater located in the same room with BHW-10, & 11 that has a in-line gas pressure regulator that is not vented to a safe discharge outside the building as per NFPA 54, 9.1.19(1).
5) he vent valve discharge piping located between the two safety shutoff valves (SSOV) is combined to a common manifold with the diaphragm gas pressure regulator (1 ea) vent piping and gas pressure switches (2 ea) in violation of ASME CSD-1, CF-190(f)(2).
Note: The water heater drain valve is inoperable (encrusted with mineral deposits), and there is no thermometer installed at or near the outlet as required per ASME Code, Section IV, HLW-820

SECTION VII – RECOMMENDATIONS

1) Install leak test valve downstream of first SSOV (safety shutoff valve) on fuel train not less than 1/8".
2) Install vent piping from pilot gas pressure regulator outside of building and if installed to a common manifold insure correct size vent piping having a minimum cross-sectional area as required per ASME CSD-1, CF-190(f).
3) Replace pressure gage with one having a dial calibrated to not less than 0-150 (1.5 x 100) psi and not greater than 0-350 (3.5 x 100) psi.
4) Install vent piping from in-line gas pressure regulator on water heater fuel train to atmosphere outside of building and insure vent line meets NFPA 54, 9.1.19(3) requirements.
5) Install separate vent piping (SSOV vent valve & diaphragm regulators) leading outside of building with discharge directed downward and covered with fine mesh screen at the discharge to keep out moisture and insects per NFPA 54 and ASME CSD-1, CF-190(h)(1).

Attachment A. Lockout/Tagout Pre-job Walk-down Checklist (Page 1 of 2)

Instructions: Perform the pre-job walk-down with the necessary people per Section 3.1 of the Requirements Notice 101-3-01. Complete this checklist and take signed checklist to the lock coordinator. All Authorized Workers are required to participate in the walk-down and sign the checklist in order to check out a lock and tag. If additional workers are added to the job, they must also perform a walk-down of the system and show a signed checklist to the lock coordinator. The signed checklists are to be kept with the parent work document (IWD, work package, etc.).

Work Document Number (e.g., Package/Procedure#): _____

- ☐ We have walked down and discussed the work to be performed.
- ☐ All energy isolation points and positions have been identified and documented.
- ☐ The proper energy control procedure is being used (Simple vs Complex LO/TO).
- ☐ All energy-isolating devices are labeled properly (e.g., labels aren't faded, no hand written modifications).
- ☐ No discrepancies are found between record drawings, labels, panel schedules, and LO/TO procedures.
- ☐ Lockout devices have been identified to support the work.

*If any of the above items are identified to be inadequate, pause work, report the issues to your RLM, and contact the appropriate SMEs to help resolve issues ***before*** performing/resuming work.

1.0 PRE-MAINTENANCE ACTIVITIES

NOTE Preoperational and pre-maintenance activities shall be conducted per the work order package, e.g., lockout/tagout, permits, special instructions, etc.

! WARNING If purging of gas lines will be required during this maintenance, ensure that the purging activity is addressed in the Integrated Work Document (IWD). The following must be addressed (see Master Specification 23 1123):

1. Purged fuel gases shall be directly vented to a safe location outdoors, away from personnel and ignition sources. This may be accomplished through permanent piping or temporary piping or hosing.
2. If it is not possible to vent purged gases outdoors, the following conditions must be met:
   a. Purging activity must be approved by the LANL Fire Marshal based on a documented justification detailing why outdoor venting is not possible and IWD.
   b. Gas concentration in the space to which the purge is vented shall be maintained at no more than 25% of the Lower Explosive Limit (LEL). For natural gas, the LEL is a concentration of 5% in air or 50,000 ppm. Therefore a maximum concentration of 12,500 ppm is allowed for natural gas. The concentration may be controlled by providing adequate ventilation or by limiting the amount of purge gas.
   c. Combustible gas detectors shall be used during the purging operation to monitor the gas concentration.
   d. Nonessential personnel shall be evacuated from the vicinity (including adjacent spaces) during the purging operation.
   e. Ignition sources in the purging space shall be controlled or eliminated.

NOTE All repair work, adjustments, or the replacement of parts shall be done in accordance with the manufacturer's procedures, specifications, recommendations, and instructions.

NOTE: When performing steps b. thru e. Boiler water and all solids MUST be contained and not go down the drain.

The following steps are needed to complete waterside maintenance.

a). Open flue door and inspect tube sheets for water leakage. It tube leakage is suspected call the system engineer for further evaluation. The narrow ligaments between tube holes are subject to tremendous stresses and should be watched for any sign of cracking mainly due to overheating.

b). Drain boiler and remove all hand hole and manhole covers, where applicable, to allow a visual check of all internal accessible areas. Example: shell, tubes and tube sheets.

c). Carefully examine waterside surfaces using a strong light and mirror where required. Look for evidence of scale, corrosion, blisters, or pitting, indicating adequacy of water treatment.

d). Use a high pressure hose to wash sediment out of the bottom and other internals of the boiler.

e). Remove both head covers from the bodies of the two float operated low water cut-offs (LWCs).

The float-assembly and mercury switches are located on these heads. Flush out both LWC bodies. Inspect floats and replace if necessary. Reinstall head covers. Remove caps from the inspection crosses associated with both LWCs and flush out piping connected to boiler. Reinstall caps.

1.0 PRE-MAINTENANCE ACTIVITIES

NOTE Preoperational and pre-maintenance activities shall be conducted per the work order package, e.g., lockout/tagout, permits, special instructions, etc.

! WARNING If purging of gas lines will be required during this maintenance, ensure that the purging activity is addressed in the Integrated Work Document (IWD). The following must be addressed (see Master Specification 23 1123):

1. Purged fuel gases shall be directly vented to a safe location outdoors, away from personnel and ignition sources. This may be accomplished through permanent piping or temporary piping or hosing.
2. If it is not possible to vent purged gases outdoors, the following conditions must be met:
   a. Purging activity must be approved by the LANL Fire Marshal based on a documented justification detailing why outdoor venting is not possible and IWD.
   b. Gas concentration in the space to which the purge is vented shall be maintained at no more than 25% of the Lower Explosive Limit (LEL). For natural gas, the LEL is a concentration of 5% in air or 50,000 ppm. Therefore a maximum concentration of 12,500 ppm is allowed for natural gas. The concentration may be controlled by providing adequate ventilation or by limiting the amount of purge gas.
   c. Combustible gas detectors shall be used during the purging operation to monitor the gas concentration.
   d. Nonessential personnel shall be evacuated from the vicinity (including adjacent spaces) during the purging operation.
   e. Ignition sources in the purging space shall be controlled or eliminated.

NOTE All repair work, adjustments, or the replacement of parts shall be done in accordance with the manufacturer's procedures, specifications, recommendations, and instructions.

6.2. **PERFORM** a LOTO pre-job walk-down for control of hazardous energy per P101-3 Lockout/Tagout for Hazardous Energy Control.

6.3. **MOBILIZE** equipment/materials/tools to and from work site.

6.4. **BARRICADE** designated work area using robust barrier rope/stanchion and/or signage, to establish boundaries.

⚠ CAUTION

Congested area. Trip hazards – floor drains and piping systems.

NOTE:

Ops tech to align system prior to performing work and when work is complete.

MAINTENANCE

6.5. **OBSERVE** temperature and operating pressure general conditions. Fire cycle boiler. The boiler should start smoothly without unusual noises.

6.6. **VISUALLY** inspect combustion. Changes in flame shape, color, and sound are among early indicators of potential combustion-related problems. Changes may be due to changes in fuel pressure or gas/air linkage movement.

Work Document #: (WO#/Task#) 00700042001			**Planner/Preparer (Name/Z#/Date)** Jennifer Simmons Z # 364268 Date 4/13/2022
TA: 55	**Building:** 0006	**Room:** 103	**Additional Location Description:**

6.7. **CHECK** gas/air linkages on power burners that modulate for positioning, tightness, and binding. Combustion analysis is verifiable only with a flue gas analyzer and is performed mainly on boilers with power burners. Adjust air/fuel mixture as needed.

6.8. **DETERMINE** the cause of any unusual noises or conditions and correct as needed. Report any needed corrections to the Facility Coordinator for corrective maintenance.

6.9. **INSPECT** fuel supply system and gas controls. Leak-check gas controls and associated gas piping with a gas detector or soapsuds. **VERIFY** gas pressure at utility regulator is the same pressure at the boiler to ensure the natural gas piping does not contain any restriction or blockage.

6.10. **TEST** float-operated low water fuel cut-off (LWC) by pressing the *Manual Reset Low Water* button (hold button for approximately 8 seconds). This will simulate a low water condition by turning off the boiler.

6.11. **TEST** the safety relief valve (Try Lever Test). Manually open the valve by lifting up on the handle while boiler is under pressure. Water should flow when this is done and should shut off completely when the handle is released. Some boilers have two of these devices.

⚠CAUTION

The discharge from valves is under pressure and at high temperatures. Exercise caution to avoid personal injury or injury to others.

6.12. **OBSERVE** the operation of operating controls. Operating controls start, stop, and modulate some burners (if desired) in response to system demand, keeping water temperature at or below controller setting.

6.13. **TEST** limit controls: high limit, air switch, etc.

6.14. **TEST** flame detection devices on boilers with flame scanners. Remove the flame scanner with the burner firing. The burner should shut off as a flame failure condition. Clean the flame scanner, reinstall and reset programmer. Check for proper operation as boiler goes through a firing cycle and light off.

Electricians perform steps 6.15.1 through 6.15.4

NOTE:

LOTO devices shall be applied in accordance with requirements of P101-3, Lockout/Tagout for Hazardous Energy Control.

6.15. **PLACE** B602 and B603 in the OFF position at Boiler Control Panel. Work on only one boiler at a time.

6.15.1. **PLACE** MCC compartment located in Rm 101 in the OFF position and apply LOTO. When de-energizing B602, place MCC-603D-B1L in the OFF position and apply LOTO. When de-energizing B603, place MCC-603C-A2R in the OFF position and apply LOTO.

Calibration Verification

Verify that the instrument to be used on this PM is within calibration:

Voltage meter: Manufacturer/ Model #: Fluke T-5 1000

File #: 040937 Expiration Date: 08/06/22

6.15.2. **VERIFY** "0" voltage at line side of disconnect

- **B602: DISC-602-1**
- **B603: DISC-603-1**

6.15.3. **CHECK** all electrical controls and circuitry. Careful inspection may disclose any of the following items: cracked insulators (probe type), jumpered conditions, loose connections, poor or deteriorated wiring and contact points of foreign matter, improperly used bypass switches, cut-off switches wired in parallel, shutoffs installed at improper levels. Document any issues on the work document.

6.15.4. **REMOVE** LOTO devices. Place boiler circuit in the ON position.

- **B602: MCC-603D-B1L**
- **B603: MCC-603C-A2R**

6.15.5. **PLACE** boiler back in service to complete preventive maintenance.

6.16. **OBSERVE** condition of expansion tank. A waterlogged expansion tank will cause the safety relief valve on a hot water heating boiler to relieve every time that it fires. This causes the introduction of makeup water, causing a dilution of the water chemistry in a treated system. Drain expansion tank if it is of a non-bladder type and refill to reestablish an air cushion. Check the air pressure on bladder-type expansion tanks.

ATTACHMENT A: SEMI- ANNUAL MAINTENANCE DATA SHEET FOR HOT WATER BOILER

TA	55	ROOM	103	DATE	06/06/22
BLDG	6	EQUIP. ID	B-602		

STEP	DESCRIPTION	S	U	N/A	COMMENTS AND DEFICIENCIES
1.0	***Pre-Maintenance***				
	NOTE: **Preoperational and pre-maintenance activities shall be conducted per the work order package, e.g.: lock out/tag out, permits, special instructions, etc.**				
	NOTE: **All repair work, adjustments, or the replacement of parts shall be done in accordance with the manufacturer's procedures, specifications, recommendations and instructions**				
1.1	Notify area Operations Center that work will be in progress on the boiler system.	✓			
2.0	***Maintenance***				
2.1	Observe temperature and operating pressure and general conditions. Fire and cycle boiler. The burner should start smoothly without unusual noises.	✓			
2.2	Visually inspect combustion. Changes in flame shape, color and sound are among early indicators of potential combustion-related problems. Changes may be due to changes in fuel pressure or gas/air linkage movement.	✓			
2.3	Check gas/air linkages, on power burners that modulate, for positioning, tightness and binding. Combustion analysis is verifiable only with a flue gas analyzer and is performed mainly on boilers with power burners. Adjust air/fuel mixture as needed.	✓			
2.4	Determine the cause of any unusual noises or conditions and correct as necessary. Report any needed corrections to the Facility Coordinator for corrective maintenance.	✓			
2.5	Inspect fuel supply system and gas controls. Leak check gas controls and associated gas piping with a gas detector or soapsuds. Verify gas pressure at utility regulator is the same pressure at the boiler. To ensure the natural gas piping does not contain any restriction or blockage.	✓			
2.6	Test float-operated low water fuel cut-off (LWC) by pressing the '*Manual Reset Low Water*' button (hold button down for approximately 8 seconds). This will simulate a low water condition by turning off the boiler.	✓			

#716042 01

STEP	DESCRIPTION	S	U	N/A	COMMENTS AND DEFICIENCIES
	NOTE: **On hot water heating boilers it may be necessary to trip the float assembly linkage manually, after blowing down the LWC, to make the mercury switch trip. This is done because a hot water boiler is full of water and will not always trip the mercury switch in the LWC, like a steam boiler will, when the LWC is blown down. Remove the cover on top of the LWC to access the float assembly linkage. It is crucial that the burner shuts off immediately after this test.**				
2.7	Test safety relief valve (Try Lever Test). Manually open the valve by lifting up on the handle while boiler is under pressure. Water should flow when this is done and should shut off completely when the handle is released. Some boilers have two of these devices.	✓			
	⚠ CAUTION **The discharge from these valves is under pressure and is at high temperatures. Exercise caution to avoid personal injury or injury to others.**				
2.8	Observe the operation of operating control. Operating controls start, stop and modulate some burners (if desired) in response to the systems demand, keeping water temperature at or below controller setting.	✓			
2.9	Test limit controls: high limit, air switch, etc.	✓			
2.10	Test flame detection devices on boilers with flame scanners. Remove the flame scanner with the burner firing. The burner should shut off as a flame failure condition. Clean the flame scanner, reinstall and reset programmer. Check for proper operation as boiler goes through a firing cycle and light off.	✓			
2.11	Check all electrical controls and circuitry. Careful inspection may disclose any of the following items: cracked mercury tubes, separation of mercury, cracked insulators (probe type), jumpered conditions, loose connections, poor or deteriorated wiring and contact points of foreign matter, improperly used bypass switches, cut-off switches wired in parallel, shutoffs installed at improper levels, wedges behind mercury tubes.	S			GT 17386
2.12	Observe condition of expansion tank. A waterlogged expansion tank will cause the safety relief valve, on a hot water heating boiler, to relieve every time that it fires. This causes the introduction of makeup water, causing a dilution of the water chemistry in a treated system. Drain expansion tank if it is of a non-bladder type and refill to reestablish an air cushion. Check the air pressure on bladder-type expansion tanks.	✓

2.13	Observe operation of circulating pumps. Lubricate pump motors if they are of the type that needs lubrication.	✓			
2.14	Observe operation of forced draft fan motors on boilers with power burners and induced draft fan motors on horizontal breeching where applicable. Lubricate fan motors if they are of the type that needs lubrication.	✓			
2.15	Check pressure-reducing valve. Replace the strainer in the valve if needed.	✓			
2.16	Check condition of heating surfaces. (Example: leaking handhole covers, hot spots, etc.)	✓			
2.17	Check combustion air supply openings to ensure that they are not closed or stopped up.	✓

STEP	DESCRIPTION	S	U	N/A	COMMENTS AND DEFICIENCIES
1.0	***Pre-Maintenance***				
	NOTE: **Preoperational and pre-maintenance activities shall be conducted per the work order package, e.g.: lock out/tag out, permits, special instructions, etc.**				
	NOTE: **All repair work, adjustments, or the replacement of parts shall be done in accordance with the manufacturer's procedures, specifications, recommendations and instructions**				
1.1	Notify area Operations Center that work will be in progress on the boiler system.			✓	
2.0	***Maintenance***				
2.1	Observe temperature and operating pressure and general conditions. Fire and cycle boiler. The burner should start smoothly without unusual noises.			✓	
2.2	Visually inspect combustion. Changes in flame shape, color and sound are among early indicators of potential combustion-related problems. Changes may be due to changes in fuel pressure or gas/air linkage movement.			✓	
2.3	Check gas/air linkages, on power burners that modulate, for positioning, tightness and binding. Combustion analysis is verifiable only with a flue gas analyzer and is performed mainly on boilers with power burners. Adjust air/fuel mixture as needed.			✓	
2.4	Determine the cause of any unusual noises or conditions and correct as necessary. Report any needed corrections to the Facility Coordinator for corrective maintenance.			✓	N/A
2.5	Inspect fuel supply system and gas controls. Leak check gas controls and associated gas piping with a gas detector or soapsuds. Verify gas pressure at utility regulator is the same pressure at the boiler. To ensure the natural gas piping does not contain any restriction or blockage.			✓	
2.6	Test float-operated low water fuel cut-off (LWC) by pressing the '*Manual Reset Low Water*' button (hold button down for approximately 8 seconds). This will simulate a low water condition by turning off the boiler.			✓	✓

#716042 01

STEP	DESCRIPTION	S	U	N/A	COMMENTS AND DEFICIENCIES
	NOTE: **On hot water heating boilers it may be necessary to trip the float assembly linkage manually, after blowing down the LWC, to make the mercury switch trip. This is done because a hot water boiler is full of water and will not always trip the mercury switch in the LWC, like a steam boiler will, when the LWC is blown down. Remove the cover on top of the LWC to access the float assembly linkage. It is crucial that the burner shuts off immediately after this test.**
